### **About RAND**

The RAND Corporation is a research organization that develops solutions to public policy challenges to help make communities throughout the world safer and more secure, healthier and more prosperous. RAND is nonprofit, nonpartisan, and committed to the public interest. To learn more about RAND, visit [www.rand.org](http://www.rand.org).

### **Research Integrity**

Our mission to help improve policy and decision making through research and analysis is enabled through our core values of quality and objectivity and our unwavering commitment to the highest level of integrity and ethical behavior. To help ensure our research and analysis are rigorous, objective, and nonpartisan, we subject our research publications to a robust and exacting quality-assurance process; avoid both the appearance and reality of financial and other conflicts of interest through staff training, project screening, and a policy of mandatory disclosure; and pursue transparency in our research engagements through our commitment to the open publication of our research findings and recommendations, disclosure of the source of funding of published research, and policies to ensure intellectual independence. For more information, visit [www.rand.org/about/research-integrity](http://www.rand.org/about/research-integrity).

RAND's publications do not necessarily reflect the opinions of its research clients and sponsors.

---

The Health and Retirement Study (HRS) is a longitudinal household survey conducted by the Institute for Social Research at the University of Michigan with funding from the National Institute on Aging (grant numbers NIA U01AG009740 and NIA R01AG073289) and the Social Security Administration. The HRS is extraordinarily rich and complex, and its multidisciplinary data provide researchers the opportunity to investigate many different aspects related to population aging in the United States. With the goal of making the data more accessible to researchers, the RAND Center for the Study of Aging, with funding and support from the National Institute on Aging (NIA) and the Social Security Administration (SSA), has created the RAND HRS data products. This document describes the RAND HRS Longitudinal File.

## **Citation Instructions:**

## Preface

The Health and Retirement Study (HRS) is a longitudinal household survey conducted by the Institute for Social Research at the University of Michigan with funding from the National Institute on Aging (grant numbers NIA U01AG009740 and NIA R01AG073289) and the Social Security Administration. The HRS is extraordinarily rich and complex, and its multidisciplinary data provide researchers the opportunity to investigate many different aspects related to population aging in the United States. With the goal of making the data more accessible to researchers, the RAND Center for the Study of Aging, with funding and support from the National Institute on Aging (NIA) and the Social Security Administration (SSA), has created the RAND HRS data products. This document describes the RAND HRS Longitudinal File.

The RAND HRS Longitudinal File is a cleaned, easy-to-use, and streamlined data product containing information from Core and Exit Interviews of the HRS, with derived variables covering a large range of topics. It contains variables on demographics, health, health insurance, Social Security, pensions, family structure, retirement plans, expectations, and employment history, as well as imputations for income, assets, and medical expenditures developed at RAND. All variables are named and derived consistently across survey years, and any cross-wave differences are documented.

Every individual who has ever completed an HRS Core Interview has a record in this file, and in households with a married or partnered couple, both Respondents' records also capture HRS responses given by the spouse or partner. As such, the RAND HRS Longitudinal File meets the essential needs of many research projects; however, we note that although the file contains a rich subset of information from the Core and Exit Interviews, it is not exhaustive. In cases where researchers cannot find all variables they need, the file can easily be merged with other RAND HRS data products, as well as those released separately by our HRS colleagues at the University of Michigan.

The RAND HRS Longitudinal File 2020 (V2) includes fifteen waves of Core Interview data across seventeen survey years (1992, 1993, 1994, 1995, and biennially 1996-2020) as well as Exit Interview data collected across fifteen survey years (1994, 1995, and biennially 1996-2020). The file also encompasses all seven entry cohorts: the initial 1992 Health and Retirement Study (HRS) cohort; the 1993 Study of Assets and Health Dynamics (AHEAD) cohort; the Children of Depression and War Baby cohorts entering in 1998; the Early Baby Boomer cohort entering in 2004; the Mid Baby Boomer cohort entering in 2010; and the Late Baby Boomer cohort entering in 2016. For more information about the RAND HRS data products, please visit the [RAND Center for the Study of Aging website](#).

We are grateful for the continuing support of and funding from the NIA and SSA. In gaining access to and interpreting the HRS, we greatly benefited from the help and insights of HRS staff members. In particular, we thank Bob Willis, Cathy Liebowitz, Michael Nolte, David Weir, Thomas Juster, Dorothy Nordness, Marita Servais, Dave Howell, Honggao Cao, Janet Keller, Theresa Norgard, Tom Blackburn, Gwenith Fisher, Julia Roach, and Jody Schimmel. We also acknowledge Howard Iams (SSA) and John Phillips (NIA) for their guidance and suggestions on the file structure and distribution process. Howard Iams, Melissa Koenig, Sharmila Choudhury, Irena Dushi of SSA continue to provide valuable input with their suggestions for additional variables, including measures regarding pensions, poverty, and retirement. We thank Kanika Kapur, Jeannette Rogowski, and Nicole Maestas at RAND for their guidance and suggestions for additional health insurance variables, and Lionel Deang of SSA for his input on these variables.

We thank all the analysts using the data who have alerted us to problems and given us suggestions. Previous versions of the RAND HRS Longitudinal File benefited from the input of David Blau, Adeline Delavande, Zach Gassoumis, Dan Waldo, Vipul Bhatt, Steven Haider, Constantijn Panis, David Loughran, Nicole Maestas, Xiaoyan Li, Eric French, Christy Thompson, Ann Huff Stevens, Daver Kahvecioglu, Bob Weathers, Peiyun She, David Stapleton, Donna MacIsaac, Vicki Freedman, Jennifer Cornman, Yuyan Shi, Melissa Rayner, Julie Zissimopoulos and Natalia Emanuel.

Special thanks to Cary Greif, the Research Operations Administrator of the RAND Center for the Study of Aging, who has assisted our data development efforts in many ways and at many levels, and to Nancy Campbell, Chris Chan, Adam Karabatakis, Joshua Mallett, Joyce Marks, Michael Moldoff, and Patricia St. Clair who contributed as research programmers on previous versions of the RAND HRS Longitudinal File.

## What's New in the RAND HRS Longitudinal File 2020 (V2)?

The RAND HRS Longitudinal File 2020 (V2) incorporates the Final Release Core Interview data for 2020, the Final Release Exit Interview data for 2020, the updated Cross-wave Tracker (2020 Final V1.0), and the most recent version of the Region and Mobility file. It contains 42,405 observations or rows. It is a Respondent-level file so each row represents a unique Respondent. It also adds new variables and makes adjustments and corrections. The current versions of the Core, Exit, and Cross-wave data used in the RAND HRS Longitudinal File 2020 (V2) are:

- 1992 Final V1.01
- 1993 Final V2.1 (March 1998)
- 1994 Final V1.0 (September 2004)
- 1995 Final V2.0 (August 2007)
- 1995 Exit Final V1.0 (February 2003)
- 1996 Final V4.0 (March 2007)
- 1996 Exit Final V1.0 (September 2003)
- 1998 Final V2.3 (November 2003)
- 1998 Exit Final V1.0 (January 2005)
- 2000 Final V1.0 (April 2004)
- 2000 Exit Final V1.0 (March 2005)
- 2002 Final V2.0 (July 2006)
- 2002 Exit Final V1.0 (December 2006)
- 2004 Final V1.0 (May 2016)
- 2004 Exit Final V1.0 (February 2007)
- 2006 Final Release V4.0 (August 2021)
- 2006 Exit Final Release V1.0 (October 2008)
- 2008 Final Release V3.0 (December 2014)
- 2008 Exit Final Release V1.0 (November 2010)
- 2010 Final Release V6.0 (August 2021)
- 2010 Exit Final Release V2.0 (September 2012)
- 2012 Final Release V3.0 (March 2020)
- 2012 Exit Final Release V1.0 (March 2015)
- 2014 Final Release V2.0 (December 2017)
- 2014 Exit Final Release V1.0 (March 2016)
- 2016 Final Release V2.0 (December 2019)
- 2016 Exit Final Release V1.0 (December 2018)
- 2018 Final Release V2.0 (May 2022)
- 2018 Exit Final Release V1.0 (November 2022)
- 2020 Final Release V1.0 (May 2023)
- 2020 Exit Final Release V1.0 (September 2023)
- HRS 2020 Final Tracker V1.0 (January 2024)
- Cross-Wave Region and Mobility File (Final V9.0) (May 2023)
- Master ID File 2008 V1.0 (December 2009)
- Cross-Wave Imputation of Cognitive Functioning Measures 1992-2020 Final V3.0 (May 2023)
- Cross-Wave Prospective Social Security Wealth Measures of Pre-Retirees 1992-2020 V1.0 (March 2024)

In 2018 we changed the naming convention for the RAND HRS Longitudinal File. Previously, we used letters to denote subsequent versions (i.e., RAND HRS Version P). Now, we use the year of the latest HRS wave that is included in the longitudinal file and a version number. This current release is hence called RAND HRS Longitudinal File 2020 (V2), as this is the second RAND HRS Longitudinal File version with 2020 data.

## Changes to Identifiers:

### HHIDPN

In the 2020 Final Release Core Interview Data V1.0 (May 2023), HRS dropped HHIDPN = 501126021 as it was determined to be a duplicate of HHIDPN = 501126010. This was due to the interview for this Respondent being identified as a new spouse Respondent in the early release data when in fact this interview was for the existing spouse.

### Spouse Person Number (RPN\_SP)

In the 2020 Early Release Core Interview Data V2.0 (August 2022) there were approximately 1,000 Respondents for whom RPN\_SP (2020 SPOUSE/PARTNER PERSON NUMBER) was not assigned. These have been filled in the 2020 Final Release Core Interview Data V1.0 (May 2023). In the previous version of the RAND HRS Longitudinal File 2020 (V1) these records were flagged as .V (Spouse did not respond this wave) across many of our spouse variables. Indeed, the vast majority of these spouses did not respond to the HRS 2020 interview, but for the small number who did, they now have non-missing values for some of the key variables provided in this file (e.g., S15MSTAT).

## New Variables:

### Cognition Variables

We have incorporated the latest version of HRS's [Cross-Wave Imputation of Cognitive Functioning Measures 1992-2020](#). For Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or elicitation method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews (i.e. person/phone) and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews (i.e. person/phone) measure is provided. Please review the HRS documentation linked above and the specific variable documentation in the relevant subsections of Section B: Health for more information. In addition, RwCOG27, the 27-point cognition summary score, was added for Waves 3 forward.

### Health Conditions Variables

We added new categorical variables that indicate if a Respondent reports that a doctor has ever told them that they have the specified condition. These variables take the value 0 or 1 to indicate whether the Respondent has ever reported having had the given condition. Once a Respondent has given two consecutive reports of having had the condition, the variable is set to 1 for all future waves—even if the Respondent later disputes an earlier report, and it is set to 0 for all waves prior to the first of two consecutive reports.

The new variable sets are generated for the original 8 conditions asked since the inception of the survey which include: RwHIBPE2, RwDIABE2, RwCANCRE2, RwLUNGE2, RwHEARTE2, RwSTROKE2, RwPSYCHE2, and RwARTHRE2, as well as 3 memory-related disease questions added later: RwMEMRYE2 (Waves 4-9) and RwALZHEE2 and RwDEMENE2 (Wave 10 forward).

### Urbanicity Variables

We added RwURBRUR, which provides the urbanicity of the Respondent's county of residence at Wave "w." Please See the Urbanicity section in Section A: Demographics, Identifiers, and Weights for more information.

## Adjustments, Improvements, and Corrections to the Data and Documentation:

### Cognition Variables

At the time of the RAND HRS Longitudinal File 2020 (V1) release, the HRS team was working on updates to the cognition measures, especially affecting Waves 14 and 15. These changes have been incorporated in this release (RAND HRS Longitudinal File

2020 (V2)). You will now find Wave 14 and Wave 15 variables for all Imputed Cognition measures. Note that the variable naming structure has changed. Please see the "Cognition Variables" paragraph in the "New Variables" section above for more information, including the link to HRS's documentation.

### **Social Security: Predicted SS wealth of Pre-retirees**

The variables in the "Predicted SS wealth of Pre-retirees" section in Section F: Social Security have been updated to incorporate changes implemented in the recent HRS release of the [Cross-Wave Prospective Social Security Wealth Measures of Pre-Retirees](#). This release replaces all other public-use Social Security benefits wealth data products from HRS, expands the data to cover every wave, and re-calculates the wealth measures in earlier waves based on newly available linked Social Security earnings records as of the 2020 wave. Specific edits and improvements include the following:

1. In previous versions of the Predicted Social Security wealth of Pre-retirees variables we renamed Respondent spousal/survivor benefit variables and assigned spouse versions of both beneficiary and spousal/survivor benefit variables as a convenience for users. The new release of the Cross-Wave Prospective Social Security Wealth Measures of Pre-Retirees provides Respondent spousal/survivor wealth variables and assigns spouse variables for both the Respondent wealth and Respondent spousal/survivor benefit variables using a similar method. We now take these variables from the HRS file rather than produce them.
2. The household variables for total household wealth (HwSSWRER, HwSSWRNR, and HwSSWRXA) have been expanded to cover all waves (originally Waves 1, 4, 7, 10, and 13). Please note that these variables use a stricter method for what constitutes a household that is aligned with the Social Security definition of a household.
3. The Respondent/spouse variables for wealth based on own earnings (R/SwSSWRER, R/SwSSWRNR, and R/SwSSWRXA) and the Social Security claimed status (R/SwCLAIMED) have been expanded to cover all waves (originally Waves 1, 4, 7, 10, and 13).
4. The Respondent/spouse variables based on spousal/survivor benefits (R/SwSSWSER, R/SwSSWSNR, and R/SwSSWSXA) have been expanded to cover all waves (originally Waves 10 and 13).
5. We assign a new missing code ".N=R ineligible for SSW measure" to reflect that the HRS file does not calculate predicted Social Security Wealth variables for the AHEAD and CODA cohorts (see HRS documentation for more details).

It is important to note that the method for calculating the Social Security wealth amounts has changed considerably. Therefore, users should expect to see substantial differences compared to the previous version. Please review the HRS documentation linked above and the documentation in the "Predicted SS wealth of Pre-retirees" section in Section F: Social Security for more information.

### **Helper Variables**

In 1995 and 1996, we identified several child and grandchild OPNs on the Helper List that did not appear on the 1995 A95E\_R and 1996 H96E\_R datasets. We examined likely matches between the files based on relationship code and have made the adjustments to the A95E\_R and H96E\_R datasets listed in a new section of Appendix A: titled "Section D: OPN adjustments." These adjustments improve all 1995 and 1996 helper variables by linking the relationship code to the days and hours of help, along with helper payments. We believe there are additional linkages that could be made in future versions as the focus of the current improvements are linking children and grandchildren helpers only.

In addition, two corrections were implemented for the helper variables in Waves 3, 4 and 5. The first update rectified an error where "Other individuals" were incorrectly identified as family helpers instead of non-family helpers. This affects the family helper variables (RwINHPFN, RwHLPRFN, RwHLPDYSF, RwHLPHRSF, RwHLPPDFN, RwHLPPDFA) and the non-family helper variables (RwINHPNFN, RwHLPRNFN, RwHLPDYSNF, RwHLPHRSNF, RwHLPPDNFN, RwHLPPDNFA). The second update corrected an error in the "Number of helpers ever helped" variables (RwINHPTN, RwINHPPN, RwINHPUN, RwINHPFN, RwINHPNFN) where those who did not help last month were excluded from the count. The associated spouse helper variables were also corrected.

### **Functional Limitation Variables**

We implemented several edits and improvements to the functional limitations variables this version. These variables include the raw recodes and the "any difficulty" variables for the activities of daily living variables (ADLs), the instrumental activities of daily

living (IADLs), and the other functional limitations variables. The effect of these edits also impact the ADL, IADL, and Other Summary Indices variables. These edits and improvements include:

1. Changed the numeric value of "Don't do" from 9 to 7 in the raw recode variables.
2. Changed .S=Skip to .M=Oth missing for partial interviews and other non-responses from eligible Respondents.
3. Changed .S=Skip to logical imputes of zero for the "gets help" variables.
4. Extended logical imputes of the RwJOG variables to assign can't do/don't do values if reported can't do/don't do to RwWALKS or RwWALK1.
5. Extended logical imputes of the RwMEDSA and RwMEDSH variables to 0.No Difficulty and 0.No help respectively if RwMEDS is .Z=don't do/wouldn't if did.
6. Reduced the logical imputation in the raw recode variables and kept or expanded the logical imputation in the "any difficulty" variables. These edits include:
  - (a) If Respondents are not asked ADL questions because they do not have difficulty with previously asked functional limitations, the raw recodes are set to ".S=Skipped" and the any difficulty variables are set to "0. No difficulty."
  - (b) If Respondents report they don't do, don't know, or refuse if they have difficulty performing an ADL, but report they do get help with that ADL, the raw recode variable is left as reported (don't do, don't know, or refuse) but the any difficulty question is assigned "1. Yes difficulty."

### **Pension: Employer's Contribution to DC Plan**

We adjusted the variable construction code that erroneously missed assigning Wave 15 values for cases where the Respondent reports the employer pension contribution as a dollar amount. Values have changed from missing to non-missing for 145 cases in R15DCBENE1 and R15DCMODE1, 26 cases in R15DCBENE2 and R15DCMODE2, and 5 cases in R15DCBENE3 and R15DCMODE3. The analogous spouse variables were similarly affected.

### **Imputations: Income and Wealth, Medical Expenditures, and Poverty Thresholds**

Income, wealth, medical expenditures, and poverty threshold data now include the 2020 Final Release Core Interview data. Additionally, we have made some improvements to the file and associated documentation, including the following:

#### **Nursing Home Residency**

We have updated several variables in the RAND HRS Longitudinal File from 2016 (Wave 13) forward to be consistent with the Tracker xNURSHM variables. Specifically, beginning in 2016, the Tracker xNURSHM variable contains a new value of "2" (Interviewed in community this wave [yes to xA028 AND residence confirmed as other than nursing home]). Previously, we treated these Respondents as living in a nursing home, but now we do not. This improvement does have some impact, most notably on the nursing home utilization, core medical expenditure, and poverty threshold variables we provide in this file:

##### Nursing home utilization

We use the xNURSHM variables from the Tracker to inform the creation of the nursing home utilization measures described in the "Medical care utilization: Nursing Home" section in Section B: Health. Specifically, RwnHMLIV now flags fewer Respondents as living in a nursing home in Waves 13, 14, and 15, affecting 120, 127, 132 Respondents, respectively. On average, the number of nursing home stays (RwnRSTIM) decreased by 3.98 percent or less, and the number of days in a nursing home (RwnHMDAY) decreased by 1.63 percent or less. The largest changes were for the number of nights in a nursing home (RwnRSNIT), which decreased by 22.06 percent in Wave 13, 18.34 percent in Wave 14, and 37.68 percent in Wave 15.

##### Core medical expenditures

We use various indicators for nursing home residency as covariates in the imputations of core medical expenditures. Therefore, the components provided in the RAND HRS Detailed Imputations File that are used to derive total out-of-pocket medical expenditures

changed as a result of the changes in nursing home status (See Section E: Medical Expenditures in the RAND HRS Detailed Imputations File Codebook for a description of the component amounts). Additionally, updates to the 2020 Core Interview data between the Early and Final release contributed to changes in medical expenditures. Specifically, amongst those with particular out-of-pocket expenditures, most amounts changed by 1.78 percent or less on average. Larger changes in Wave 15 were observed for outpatient surgery (RwMOPS, 2.49 percent decrease), special facilities and services (RwMSPEC, 6.04 percent increase), prescription drugs (RwMDRUG, 7.36 percent decrease), and other medical expenses (RwMOTHX, 12.65 percent decrease). Predictably, the largest changes were for nursing home expenditures, which decreased by 12.30 percent in Wave 13, 29.73 percent in Wave 14, and 32.89 percent in Wave 15. Overall, total out-of-pocket medical expenditures (RwOOPMD and RwOOPMDO) decreased by roughly 5 percent in Waves 13 and 14 and 6.5 percent in Wave 15.

### Poverty thresholds

Consistent with Census Bureau methods, we do not count core HRS Respondents who live in a nursing home at the time of the interview, and we further adjust total household income by subtracting their individual income. For core Respondents who are in a nursing home, all of the poverty measures are set to a special missing value (.I, for institutionalized). Hence, the changes to nursing home residency mentioned above also affect the poverty measures. However, these changes, along with the other improvements noted below, had little impact on average.

## **Poverty Thresholds**

### Poverty threshold variables for 1994 now included

We now provide the poverty threshold variables for 1994 (Wave 2H). In this wave, the Financial Respondents reported earned income for as many as nine household members. However, the household member identifiers (OPNs) that would allow us to merge their income information to key demographic information elicited in the household roster turned out to be missing, and therefore, previous versions of this file did not provide poverty measures for 1994. After conducting some investigations in conjunction with our colleagues at HRS, it was concluded that the missing link file could not be recovered. We therefore employed statistical matching techniques to construct the income and household composition variables needed to assess poverty status for Wave 2H, and to complete the series of related variables included in the RAND HRS Longitudinal File.

### Removal of versions "including institutionalized family members"

In prior versions of the RAND HRS Longitudinal File, we provided two sets of poverty threshold variables: one that is consistent with the CPS definition, which excludes institutionalized family members, and another where they are included. As part of our recent work to extend the poverty threshold variables to earlier waves, we reviewed various decisions and aspects of these measures, and decided that the CPS-consistent versions are more suitable to the analytic purposes of users, including cross-survey comparisons. Therefore, we have removed the versions including institutionalized family members from the RAND HRS Longitudinal File, including:

HwINPOVA, HwINPOVAD: Whether family income is below the poverty threshold  
 HwINPVRA, HwINPVRAD: Ratio of family income to poverty threshold  
 HwPVTHRA: Poverty threshold for the family in prior year  
 HwPVFAMA: Family composition used to determine poverty threshold  
 HwPVHHIA, HwPVHHIAD: Adjusted family income compared to the poverty threshold

### Other corrections to the poverty threshold variables

From 1995 (Wave 3A) forward, we use information in the household-member-and-child-level preload data (the "PR\_MC" files) to determine residency status for other household members. There are two categories of residency that deserve special consideration:

2. AWAY/INST: THE PERSON IS TEMPORARILY AWAY (IN SCHOOL, JAIL, REHAB, ETC.) AND DOES NOT HAVE ANY OTHER PERMANENT ADDRESS
3. AWAY/OTHER: THE PERSON IS TEMPORARILY AWAY (FOR ANOTHER REASON, SUCH AS TRAVELLING) AND DOES NOT HAVE ANY OTHER PERMANENT ADDRESS

---

In the previous version of the poverty measures, we did not include individuals with a status of "away in an institution" (Category #2). However, a deeper review of the CPS technical specifications<sup>1</sup> revealed that these individuals should be considered household residents despite being temporarily absent. Therefore, they are now included in the measures we provide in the RAND HRS Longitudinal File.

We now also exclude other household members that are not consistent with the CPS definitions. These include ex-spouses or partners, former step-children, and former children-in-law.

The corrections noted here, along with any changes to the covariates used during the imputation process, had little impact on average. Compared to the previous version, the percentage of households in poverty changed by 0.12 percentage points or less and the household income used to determine the poverty threshold changed by 0.22 percent or less. The only exception was Wave 15, where the percentage of households in poverty decreased by 0.25 percentage points and the household income used to determine the poverty threshold decreased by 1.02 percent. Such differences are to be expected, given updates to the 2020 Core Interview data between the Early and Final release.

---

# 1. Introduction and Overview

This report documents the RAND HRS Longitudinal File, a cleaned, processed, and streamlined collection of variables derived from the Health and Retirement Study (HRS). The HRS is a national panel survey of individuals over age 50 and their spouses. Its main goal is to provide panel data that enable research and analysis in support of policies on retirement, health insurance, saving, and economic well-being. The survey elicits information about demographics, income, assets, health, cognition, family structure and connections, health care utilization and costs, housing, job status and history, expectations, and insurance.

The HRS is primarily sponsored by the National Institute on Aging (NIA), with additional funding from the Social Security Administration (SSA) and administered by the Institute for Social Research (ISR) at the University of Michigan. It consists of seven cohorts:

- Initial HRS cohort, born 1931 to 1941. This cohort was first interviewed in 1992 and subsequently every two years.
- AHEAD cohort, born before 1924, initially a separate study (The Study of Assets and Health Dynamics Among the Oldest Old). This cohort was first interviewed in 1993 and subsequently in 1995, 1998, and subsequently every two years.
- Children of Depression (CODA) cohort, born 1924 to 1930. This cohort was first interviewed in 1998 and subsequently every two years.
- War Baby (WB) cohort, born 1942 to 1947. This cohort was also first interviewed in 1998 and subsequently every two years.
- Early Baby Boomer (EBB) cohort, born 1948 to 1953. This cohort was first interviewed in 2004.
- Mid Baby Boomer (MBB) cohort, born 1954 to 1959. This cohort was first interviewed in 2010.
- Late Baby Boomer (LBB) cohort, born 1960 to 1965. This cohort was first interviewed in 2016.

In addition to Respondents from eligible birth years, the survey interviewed the spouses of married Respondents or the partner of a Respondent, regardless of age. Some of the HRS and AHEAD entry cohort Respondents were spouses of HRS- and AHEAD-eligible individuals who are age-eligible for the CODA or WB cohorts. These HRS and AHEAD spouses are given weights beginning in 1998 (Wave 4) so that they contribute to the representation of the CODA/WB birth year population. Some spouses of the initial HRS entry cohort Respondents were age 70 or older and were subsequently included in the AHEAD study. These so-called HRS/AHEAD overlap cases may thus have been interviewed in 1992, 1993, 1995, and from 1998 forward.

The RAND HRS Longitudinal File contains all seven cohorts. This document refers to the entire survey as the HRS and the 1931-41 cohort that was first interviewed in 1992 is labeled the "initial" or "original" HRS entry cohort.

The HRS contains several auxiliary files. The RAND HRS Longitudinal File now incorporates both Core Interviews and Exit Interviews. It does not include any restricted data, but does use information from the current Tracker, Region and Mobility, and Master ID files.

The data include any individual interviewed at least once. This includes individuals who were age-eligible (born in eligible years) at the time of their first interview, spouses that were not age-eligible at baseline, and spouses who married an age-eligible Respondent between survey waves.

The HRS over-samples Hispanics, Blacks, and residents of Florida, and provides weighting variables to make it representative of the community-based population. From Wave 5, HRS also provides weights for individuals living in a nursing home.

The data described in this document are based on the final data releases for 1992, 1993, 1994, 1995, and biennially 1996–2020.

## 1.1. Confidentiality and Access Restrictions

The data described in this document are based on HRS public release files. Before using the data, you must obtain permission from HRS by registering with them to download the public release files. The HRS website contains information on the process to register for access to HRS public release data (<https://hrsdata.isr.umich.edu/data-products>). By registering with HRS you agree to the "Conditions

of Use" governing access to the data. This agreement applies to the use of other RAND HRS data products as well, NONE of which contain restricted data.

## 1.2. Data Files Structure

The RAND HRS Longitudinal File is distributed as a single file which includes 15 waves of the HRS. The data contain Respondents within the HRS, AHEAD, CODA, WB, EBB, MBB and LBB entry cohorts. Table 1 lists the source year of data for each of the entry cohorts, by wave. The 1993 data are treated as Wave 2 data and the 1995 data are treated as Wave 3 data for the AHEAD entry cohort. The 1994 data are treated as Wave 2 data and the 1996 data are treated as Wave 3 data for the HRS entry cohort. The AHEAD and HRS survey instruments in these years differed significantly. This documentation distinguishes between the instruments by using Wave 2A and Wave 3A to refer to the 1993 and 1995 data for the AHEAD entry cohort, and Wave 2H and Wave 3H to refer to the 1994 and 1996 data for the HRS entry cohort.

**Table 1. Source of Data for Entry Cohorts in RAND HRS Longitudinal File by Wave**

Wave	Entry Cohort							
	HRS HACOHORT=3	AHEAD HACOHORT=0,1	CODA HACOHORT=2	WB HACOHORT=4	EBB HACOHORT=5	MBB HACOHORT=6	LBB HACOHORT=7	
1	1992	1992 (HRS/AHEAD overlaps only)	Not available					
2	1994 (Wave 2H)	1993 (Wave 2A)						
3	1996 (Wave 3H)	1995 (Wave 3A)						
4	1998	1998	1998	1998	Not available			
5	2000	2000	2000	2000				
6	2002	2002	2002	2002				
7	2004	2004	2004	2004	2004	Not available		
8	2006	2006	2006	2006	2006			
9	2008	2008	2008	2008	2008			
10	2010	2010	2010	2010	2010	2010	Not available	
11	2012	2012	2012	2012	2012	2012		
12	2014	2014	2014	2014	2014	2014		
13	2016	2016	2016	2016	2016	2016	2016	
14	2018	2018	2018	2018	2018	2018	2018	
15	2020	2020	2020	2020	2020	2020	2020	

The unit of observation is an individual. Each individual is uniquely identified by a household ID (HHID) and a person number (PN). We combined these variables into a single ID variable, HHIDPN (HHIDPN: HHold ID + Person Number /Num), where  $HHIDPN = 1000 \times HHID + PN$ .<sup>2</sup> This file may be merged with other HRS data by HHIDPN.

The HRS samples at the household level. In a couple household, even if only one individual is age-eligible for the study, BOTH individuals are given an interview and treated as respondents. Please refer to our FAQ, which include various spouse-related questions, for more information (<https://www.rand.org/well-being/social-and-behavioral-policy/centers/aging/dataproduct/faq.html>).

The RAND HRS Longitudinal File is distributed in SAS, Stata, and SPSS formats, as one file that includes all 15 waves.

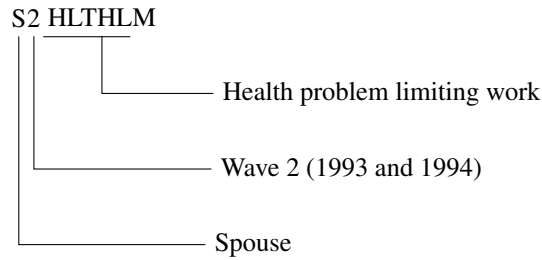

## 1.3. Variable Naming Conventions

With few exceptions, variable names in the RAND HRS Longitudinal File follow a consistent pattern. The first character indicates whether the variable refers to the reference person ("R"), spouse ("S"), or the household ("H").<sup>3</sup> The second character indicates the wave to which the variable pertains: "1," "2," "3," ... "15," "A," or "E." The "A" indicates "all," i.e., the variable is not specific to any single wave. An example is RABDATE, the birth date of the Respondent. The "E" indicates "Exit," for variables that contain data from Exit Interviews that take place after death. An example is REMSTAT, the marital status of the Respondent at time of death.

<sup>2</sup>This HHIDPN variable is numeric. Also available is RAHHIDPN (RAHHIDPN: HHold ID + Person Num /9-Char), its 9-character string equivalent.

<sup>3</sup>The reference person need not be the person who responded to the question. It is the person whose information is central to the data file observation.

The remaining characters describe the concept that the variable captures. For example:

Variable `S2HLTHLM` captures whether the spouse of the reference person experiences an impairment or health problem that limits the kind or amount of paid work s/he can do. The name of the variable does not indicate who provided the information. For example, the spouse's health problem may have been reported by the spouse themselves, or it may have been reported by the reference person as a proxy. The HRS obtains many variables, particularly on financial and family matters, by proxy.

In the text below, we may refer to variables such as `SwHLTHLM` for example, without specifying the wave. This reference points at the group of variables `S1HLTHLM`, `S2HLTHLM`, `S3HLTHLM`, ... `S15HLTHLM`.

Variable labels also follow a consistent pattern. The first characters denote the name of the variable, followed by a colon. Then follows the wave to which the variable pertains (`W1`, `W2`, `W3`, ... `W15`). The remainder of the label describes the concept that the variable captures. For example, the variable label of `S2HLTHLM` is:

`S2HLTHLM: W2 Hlth problems limit work`

It may seem duplicative to include the name of the variable and the wave in the variable label. However, SAS often suppresses the variable name and instead uses its label in the presentation of results.

## 1.4. Missing Values

Variables may contain missing values for several reasons. SAS and Stata offer the capability to distinguish multiple types of missing values, and we have attempted to record as much information as possible. SPSS does not support multiple missing codes. Generally, the codes adhere to the classification in Table 2.

**Table 2. Missing Codes**

Code	Reason for missing
.	Reference person did not respond to this wave
.D	Don't know
.R	Refused
.X	Does not apply (specifics depends on variable)
.Q	Data not available because the question was not asked
.U	Reference person is not married (for spouse variables)
.V	Spouse did not respond this wave (for spousal variables)
.S	Information not available due to skip patterns, typically because the interview is by proxy Respondent
.J	Web interview, missing
.M	Other missing
	a. No live interview (SwDDATEF, SwNDATEF)
	b. No mars, likely nev mar (RwMNEV)
	c. In NHM (R/SwHOMCAR)
	d. No utilization (R/SwTOTMBF)
	e. Not a pension, other (R/SwTYPF1-R/SwTYPF4)
	f. No Plan (R/SwCOVRT)
.N	g. None (R/SwHECOV1-R/SwHECOV3)
	h. No respondent employer-p (R/SwHERTR1-R/SwHERTR3, R/SwHERTS1-R/SwHERTS3, R/SwHERET)
	i. Cog not asked (re-IW)/1 (R/SwMO, R/SwDY, R/SwYR, R/SwDW, R/SwSCIS, R/SwCACT, R/SwPRES, R/SwVP, R/SwVOCAB)
	k. Not retired (R/SwRETSAT, R/SwRYRCMP)
.Y	No Exit Interview, No Death Recorded (for exit variables)
.Z	No Exit Interview, Death Recorded (for exit variables)

The coding scheme varies across variables. .N is defined differently in various sections. Consult the Data Codebook section of this document for details on individual variables.

Stata introduced the ability to distinguish multiple types of missing values beginning in Version 8. The RAND HRS files in Stata format are for use with Version 11 SE or later.

## 2. Conceptual Variables

Only a few variables in the RAND HRS Longitudinal File are unchanged copies of raw HRS variables. Most variables have undergone some processing, and many are the result of more than one HRS variable. Generally, the codebook indicates the names of HRS variables that were used to construct the relevant variable.

Some variables, such as *RwJLTEN* (tenure on longest job) and *RwMLEN* (duration of longest marriage) required elaborate manipulation of many variables from several sections of the HRS, but are conceptually straightforward. This section documents variables whose construction involved substantive judgments of key research concepts: health, health change, medical expenditures, and wages.

### 2.1. Health Indices

We define and derive four groups of health indices: several functional limitation indices, one depression index, one health problem index, and a body mass index. We also include cognitive health indices for which the HRS has provided imputations. A description of each index follows.

#### 2.1.1. Functional Limitations

The RAND HRS Longitudinal File contains six primary functional limitation indices. We chose these indices for their comparability with studies that measure functional limitations, our assessment of their quality, and for consistency across survey waves. We first derive a variable that indicates if the Respondent had difficulty performing a task (0=no difficulty; 1=difficulty). The exact question asked of the Respondent varies slightly across the survey waves. The responses defined by HRS are quite different in Wave 1 compared to other waves, so we do not include these measures for Wave 1.<sup>4</sup> Our measure of difficulty is defined to be comparable across the rest of the waves. The codebook provides details on the definition and calculation of 'difficulty' for all waves. All indices are the sum of the number of difficulties a Respondent has completing a particular set of tasks, and uses a definition of difficulty that is comparable across waves. Each index and the set of tasks used in the index are defined below. The variable name, for an unspecified wave, is given in parenthesis next to the index name.

*Mobility (RwMOBILA)*: The five tasks included in the mobility index are walking several blocks, walking one block, walking across the room, climbing several flights of stairs and climbing one flight of stairs. Note that this index is missing for AHEAD entry cohort Respondents and their spouses in Wave 2, because one or more of the elements in the index is not available in Wave 2A.

*Large Muscle (RwLGMUSA)*: The four tasks included in the large muscle index are sitting for two hours, getting up from a chair, stooping or kneeling or crouching, and pushing or pulling a large object. Note that this index is missing for AHEAD entry cohort Respondents and their spouses in Wave 2, because one or more of the elements in the index is not available in Wave 2A.

*Activities of Daily Living (RwADLWA, RwADLA)*: We define two activities of daily living indices. *RwADLWA* follows Wallace and Herzog (1995) and includes three tasks: bathing, eating, and dressing. *RwADLA* includes five tasks: bathing, eating, dressing, walking across a room, and getting in or out of bed.

*Gross Motor Skills (RwGROSSA)*: The four tasks in this index are chosen because of their consistency across waves. They include walking one block, walking across the room, climbing one flight of stairs, and bathing. Note that this index is missing for AHEAD entry cohort Respondents and their spouses in Wave 2, because one or more of the elements in the index is not available in Wave 2A.

*Fine Motor Skills (RwFINEA)*: The three tasks included in this index are: picking up a dime, eating, and dressing.

*Instrumental Activities of Daily Living (RwIADLA, RwLMCOGA, RwIADLZA)*: Not all waves ask the same Instrumental Activities of Daily Living (IADL) tasks. The usual IADLs were not asked in Wave 1. *RwIADLA* is consistent across all survey waves starting with Wave 2 and include: using a telephone, taking medication, and handling money. The tasks of *RwIADLZA* are asked in Wave 2A and from Wave 3 forward and include: using a telephone, taking medication, handling money, shopping, preparing meals.

<sup>4</sup>For Wave 1 only, we provide another measure of difficulty as defined in Wallace and Herzog (1995). The names of variables using this definition end in the letter "W." These are not comparable to the "some difficulty" measures in other waves.

### 2.1.2. Mental Health (RwCESD)

*Depression (RwCESD)*: We derive one mental health index, RwCESD, using a score on the Center for Epidemiologic Studies Depression (CESD) scale. The CESD score (RwCESD) is the sum of six "negative" indicators plus the inverse (one minus the variable value) of two "positive" indicators. The negative indicators measure whether the Respondent experienced the following sentiments all or most of the time: depression, everything is an effort, sleep is restless, felt alone, felt sad, and could not get going. The positive indicators measure whether the Respondent felt happy and enjoyed life, all or most of the time. In Wave 1 the allowable responses to these questions are quite different than those in other waves, so this measure is not derived for Wave 1. Please see the "Mental health (CESD score)" section in Section B: Health for more information.

### 2.1.3. Cognition

The HRS has selected a set of measures related to cognitive function that are collected fairly consistently across waves, and have imputed values for them when they are missing. The imputations are publicly available from the HRS website<sup>5</sup>, and we have included them in the RAND HRS Longitudinal File. The selected cognitive functioning measures include immediate and delayed word recall, the serial 7s test, counting backwards, naming tasks (e.g., date-naming), and vocabulary questions. In addition to the individual cognitive functioning measures, the HRS also derived three cognition summary indices, which we include in the RAND HRS Longitudinal File. The total recall index is available in all waves and summarizes the immediate and delayed word recall tasks. The mental status index sums scores from counting, naming, and vocabulary tasks and is available for Wave 2A and from Wave 3 forward. A total cognition score sums the total recall and mental status indices. RwCOG27 sums total word recall, serial 7's, and backwards counting from 20, resulting in a range of 0-27. RwCOG27 is available in Waves 3 forward and is mode-adjusted from Wave 14 forward.

### 2.1.4. Health Conditions (RwCONDE)

We derive one health problem index, RWCONDE that is the sum of indicators for whether a doctor has ever told the Respondent that s/he has ever had a particular disease. The eight included diseases are: high blood pressure, diabetes, cancer, lung disease, heart disease, stroke, psychiatric problems, and arthritis. In interviews after the baseline, prior responses were preloaded.<sup>6</sup> Each disease condition indicator variable has a corresponding flag variable that indicates whether the Respondent disputed the previous wave's indicator and whether the Respondent later denied having the condition through such a dispute. Note that the RwCONDE time series is not appropriate for tracking changes in the prevalence over time, and the individual variables without disputes incorporated should be used instead. These are available as a series of variables that recode the raw responses found in the HRS data.

### 2.1.5. Body Mass (RwBMI)

We derive one body mass index (RwBMI) that is calculated as weight divided by the square of height. Height is converted into meters and weight into kilograms. Beginning in Wave 3, height is only asked of new Respondents, but weight is asked in every wave. For Respondents being re-interviewed, height is carried forward from their first interview.

<sup>5</sup>The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

<sup>6</sup>The term "preloading" refers to information from a prior wave that the interviewer uses to prompt the Respondent. For example, suppose a Respondent indicated in Wave 2 that s/he had been diagnosed with diabetes. In Wave 3 questions, the interviewer will use this information. Typically, the Respondent is allowed to challenge preloaded information.

## 2.2. Health Change

We define and derive four groups of indices for health change: overall health, functional limitations, diagnosis, and subjective mortality risks. The health change indices are chosen for their quality in assessing health change and for their consistency across waves. Health change is calculated as health status in the current wave minus health status in the previous wave.

If a Respondent did not answer a health question in a certain wave (item non-response), the corresponding health change variable in that wave is set to missing. Similarly, if a Respondent did not participate at all in a certain wave (interview non-response), the corresponding health change variable in that wave is set to missing. If s/he did participate in the next wave, the health change variable of that next wave will be based on the most recent wave in which the Respondent participated, i.e., the change pertains to a change over four years instead of two. (Should the response to the health question in that most recent participatory wave be missing, the change will also be missing.) Separate flag variables indicate how many interviews were missed prior to the current wave. Additional flag variables are included to indicate that the Respondent disputed preloaded information.

### 2.2.1. Change in Overall Health

*Change in Self-reported Health (RwSHLTC):* These variables measure the change in self-reports of health categories "excellent," "very good," "good," "fair," and "poor." The health categories are numbered from 1 (excellent) to 5 (poor), so that positive values of the change in self-reported health denote deterioration. This measure is not available in the baseline wave.

*Self-report of Health Change (RwHLTC):* The HRS also directly asks about changes in health. The responses may be "much better" (1), "somewhat better" (2), "same" (3), "somewhat worse" (4), and "much worse" (5). Higher values denote a health deterioration. In Wave 1 for the HRS entry cohort and Wave 2 for the AHEAD entry cohort, the change in health is relative to one year ago; in subsequent waves, the changes are relative to the previous interview, two years ago.

### 2.2.2. Change in Functional Limitations

*Activities of Daily Living (RwADLC):* This variable measures the change in the index for activities of daily living (RwADLA). See above for more information on this index. It is not available in the baseline wave. Because of problems in the underlying HRS data, it is not available until Wave 3 for the HRS entry cohort.

*Gross Motor Skills (RwGROSSC):* This variable measures the change in the index for gross motor skills (RwGROSSA). See above for more information on this index. It is not available in the baseline wave. Because of problems in the underlying HRS data, it is not available until Wave 3 for the HRS entry cohort.

*Fine Motor Skills (RwFINEC):* This variable measures the change in the index for fine motor skills (RwFINEA). See above for more information on this index. It is not available in the baseline wave. Because of problems in the underlying HRS data, it is not available until Wave 3 for the HRS entry cohort.

### 2.2.3. Change in Diagnoses of Specific Health Conditions

We derive one set of variables that measure the increase in the number of health conditions since the last interview. The number of health conditions (high blood pressure, diabetes, cancer, lung disease, heart disease, stroke, psychiatric problems, arthritis) is captured in variables RwCONDE (see above); the increase since the last interview is in RwCONDS. It is not available in the baseline wave.

### 2.2.4. Change in Assessment of Relative Mortality

*Change in Relative Probability of Living to Age 75 or 85 (RwLIV75C, RwLIV85C):* We constructed two sets of variables that measure change in relative mortality risk. The HRS asks for subjective probabilities of living to age 75 and to age 85. We first computed the ratio of these reported probabilities to the probability implied by the annual Vital Statistics life tables (controlling for age and sex). The annual table used corresponds to the interview year. We then take the difference in relative mortality risks between waves. These indices are not available in the baseline wave.

In Waves 2A (AHEAD 1993), 3A (AHEAD 1995), and from Wave 5 (HRS 2000) forward, the wording for the question analogous to the

subjective probability of living to age 85 changed significantly enough that the change variable is no longer longitudinally consistent. Please see the description of these variables in the Data Codebook for more details.

## 2.3. Health Care Utilization and Medical Expenditures

The construction of health care utilization and medical expenditures variables is complicated by differences in the questions across waves. Health care utilization questions are asked in all waves, but the categories of care differ. Medical expenditure questions can be divided into two broad types: out-of-pocket expenditures, which are costs paid by the household, and total medical expenditures, which encompass costs incurred by both the household and by insurance plans on behalf of household members.

Individual out-of-pocket medical expenditure components are summed to create the two total out-of-pocket medical expenditure measures found here and in the RAND HRS Detailed Imputations File. For each measure, a flag indicates whether any or all of its components have been imputed. Individual medical expenditure components and imputation flags are available in the RAND HRS Detailed Imputations File.

Medical expenditure measures are reported at the Respondent level, with one exception. In Wave 2A, the Financial Respondent reports the medical expenditures for themselves and spouse, yielding household-level data.

### 2.3.1. Health Care Utilization

In Wave 1 (1992), Respondents are asked about hospital stays and their duration, nursing home stays and their duration, doctor visits and their number, and home health care in the twelve months prior to the interview. In Wave 2A (1993), Respondents are asked about hospital stays and their duration, nursing home stays and their duration, doctor visits and their number, prescription drugs and their quantity, outpatient surgery and dental care in the twelve months prior to the interview. In addition to the utilization questions asked of the Respondent about themselves, in Wave 2A, some utilization questions are also asked of the Financial Respondent about the entire household.<sup>7</sup> In Wave 2H (1994), the Respondents are asked about the same types of services as Wave 1, plus prescription drug use since the previous interview (for re-interviews) or in the previous two years (for new interviewees). In Wave 3H (1996), Respondents are asked about hospital stays and their duration, nursing home stays and their duration, doctor visits and their number, prescription drugs and their quantity, outpatient surgery, dental care, home health care and special facility services, and the reference period is since the previous interview (for re-interviews) or in the previous 2 years (for new interviews), and from then on, the utilization questions are consistent.

### 2.3.2. Out-of-Pocket Medical Expenditures

#### Core Interview

In Wave 1, there are no questions asked about the costs of health care services. In Wave 2A, only the Financial Respondent is asked to estimate out-of-pocket expenses in the last 12 months for the entire household for two service categories: nursing home stays and all other medical expenditures without specific reference to any of the reported utilization. In Wave 2H (1994), and in all waves going forward, both Financial and non-Financial Respondents are asked whether health care costs are covered fully or partially by insurance and asked to estimate out-of-pocket medical expenditures since the previous interview (for re-interviews) or in the previous two years (for new interviews). If Respondents are unable to provide exact estimates, a series of follow-up unfolding bracket questions are asked. In Wave 2H, Respondents are asked to report an estimate of out-of-pocket costs that considers all service categories together. From Waves 3-5, Respondents are asked about out-of-pocket spending in four categories: (1) hospital and nursing home costs; (2) doctor, dentist and outpatient surgery costs; (3) average monthly prescription drug costs; and (4) home health care and special facilities or services costs. Beginning in Wave 6, the number of categories expands to eight: (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) dentist costs; (5) outpatient surgery costs; (6) average monthly prescription drug costs; (7) home health care; and (8) special facilities costs. Beginning in Wave 10, a ninth category seeks to capture any additional out-of-pocket medical expenditures that cannot be assigned to any of the other categories.

In Wave 8 only, Respondents are asked different questions about out-of-pocket prescription drug costs depending on whether or

<sup>7</sup>The Financial Respondent is asked questions about whether either in a couple has had any hospital stays, nursing home stays, doctor visits, outpatient surgery, dental care, prescription drugs, home health care, and other services, but is not asked to quantify any of these. When a Respondent's individual answers about themselves and the Financial Respondent's household-level information are both available and in disagreement, the Respondent's own report is used. Where necessary and possible for utilization variables, we use household-level data to fill in missing Spouse information.

not they have enrolled in Medicare Part D. For those whose prescription drug use and cost are unaffected by Medicare Part D, the reported or imputed monthly average is multiplied by 24 months to estimate drug costs for the last two years. For those enrolled, two questions ask if their use or costs of prescription drugs changed. If the answer to either of these questions is "yes," then Respondents report two average monthly out-of-pocket amounts: one for the 12 months prior to coverage under Part D and another for the 12 months after. Total prescription drug costs for the last two years in Wave 8 is, then, calculated as:

$$R8MDRUG = [\# \text{ Months post-Part D} * \text{ expenses post-Part D}] + [(24 - \# \text{ Months post-Part D}) * \text{ expenses pre-Part D}]$$

The variable `RwPARTD` contains the flag for Medicare Part D status, and has the following values: 0 = No Part D, 1 = Part D but no change, and 2 = Part D and change in use or cost. The variable `R8MDRUG` can be found in the RAND HRS Detailed Imputations File.

### Exit Interview

In Wave 1 and Wave 2A, there are no Exit Interviews. In Wave 2H, we do not provide medical expenditure variables due to limited information for this wave. From Wave 3 forward, medical utilization questions cover the period between the last interview and time of death. The Respondent's Proxy is asked whether health care costs are covered fully or partially by insurance, and to estimate out-of-pocket medical expenditures between the last interview and time of death. If the Respondent's Proxy is unable to provide exact estimates, a series of follow-up unfolding bracket questions are asked.

For Exit Interviews conducted in Waves 3, 4 and 5, questions ask separately about out-of-pocket costs for the following categories of service: (1) hospital and nursing home costs; (2) doctor visit costs; (3) average monthly prescription drug costs; (4) home health care and special facilities or services costs; (5) hospice costs; and (6) other out-of-pocket medical expenditure costs.

For Exit Interviews conducted from Wave 6 to Wave 9, questions ask separately about out-of-pocket costs for the following categories of service: (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) average monthly prescription drug costs; (5) home health care costs; (6) special facilities costs; (7) hospice costs and (8) other out-of-pocket medical expenditure costs.

For Exit Interviews conducted in Wave 10 forward, questions ask separately about out-of-pocket costs for the following categories of service: (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) dentist costs; (5) outpatient surgery costs; (6) average monthly prescription drug costs; (7) home health care costs; (8) special facilities costs; (9) hospice costs, and (10) other out-of-pocket medical expenditure costs.

## **2.3.3. Total Medical Expenditures**

### Core Interview

In Waves 1 and 2, there are no questions about the total costs of all medical services. In Wave 3H, Respondents are asked to estimate total medical costs for all medical services since the previous interview. If the Respondent does not provide an exact amount, unfolding bracket follow-up questions are asked. In Wave 3A and from Wave 4 to Wave 6, an exact amount of total expenditures is not asked; all Respondents are directed into unfolding bracket questions. Starting in Wave 7, there are no questions about total medical expenditures.

### Exit Interview

We do not create Exit Interview equivalents of the Core total medical expenditures variables (`R3TOTMD/S3TOTMD`, `R3TOTMDF/S3TOTMDF`, `RwTOTMBI/SwTOTMBI`, `RwTOTMBF/SwTOTMBF`).

## **2.3.4. Imputation Process**

Where applicable, we impute out-of-pocket medical expenditures and total medical expenditures. We do not impute utilization. We do, however, include in the RAND HRS Detailed Imputations File a series of "ownership" variables that indicate if the Respondent paid out-of-pocket for at least some portion of a particular medical expense. These variables are also not imputed.

### 2.3.4.1 Out-of-Pocket Medical Expenditures

#### Core Interview

Beginning with Wave 3, we impute out-of-pocket medical expenditures across all waves using the following method. If a Respondent reports using a given service category and reports that insurance partially covered or did not cover costs for that category, we use the exact amount s/he reports.<sup>8</sup> Approximately half of those who report using a given service do not provide an exact amount; for those cases, we impute an exact amount using bracketed responses. With one exception, the imputation algorithm for imputing complete brackets and exact amounts for out-of-pocket medical expenditures is the same as the algorithm used for imputing complete brackets and exact amounts for income and wealth; it is described in detail in Section 3. As previously mentioned, we do not impute "ownership" for out-of-pocket medical expenditures.

The one difference between the out-of-pocket medical expenditures imputation process and the income and wealth imputation process occurs when we impute exact amounts for nursing home costs. Specifically, when the imputation methods for medical expenditures in the Core Interview data were developed, it was found that the tobit model we use for open-ended brackets in the income and wealth imputations fit the medical expenditures data poorly, and that nearest neighbor imputations better reflected the distribution. Therefore, the nearest neighbor is used for such cases in the medical expenditures imputation.

The imputation model predictors are age, age-squared, education, subjective health status, gender, marital status, race, whether an individual has any health insurance, whether an individual reported a hospital or nursing home stay, number of doctor visits, and whether the hospital, nursing, or doctor visit data are missing. A zero value is assigned to each category where Respondents report not using a given service category or report that insurance fully covered all associated costs. Expenditures are then summed across service categories to calculate total out-of-pocket expenditures. The procedure produces an imputed value for out-of-pocket medical expenditures for all individuals in the sample, including those with missing data.

For Wave 2A, the imputation process is slightly different. We start by imputing out-of-pocket expenditures in the two service categories in Wave 2A, nursing home expenses and all other medical expenses, both of which are reported at household-level by the Financial Respondent. If an exact amount is not provided, bracketed responses are available for both categories. There is an additional step in the imputation process for Wave 2A because the out-of-pocket expense also needs to be allocated to individuals in couple households.

Two different allocation processes are used for the spending categories. There is one couple household where both members report a nursing home stay. For this case, the household-level expense is allocated to the individuals based on the relative length of all stays. For all other households, the individual who has the nursing home stay is allocated the household-level amount.

The imputation for all other medical expenses is carried out at the household-level first, and then allocated to individuals in a second step. For consistency with other waves, values are derived for non-nursing home out-of-pocket expenses only if a Respondent reports using at least one service category other than nursing home stay and reports having partial or no insurance for any of those categories. Consistent with other waves, if an exact expenditure is reported, we use that value. If an exact amount is not reported, we impute an exact amount using bracketed responses with the same imputation algorithm used for income and wealth<sup>9</sup> and the same covariates that are used for medical expenditure imputations described above. For the household-level imputation, both male and female covariates are used. If the household is a single individual or if only one individual in a couple reports any utilization, the total imputed household-level amount is assigned to that individual.

Two additional imputation models are used in order to allocate the expense among the couples where both have any service not covered by insurance. In these models, the sample and covariates are at the Respondent level. In the first model, we assume the Financial Respondent is missing the expense and assign the Spouse the entire imputed household-level amount. In the second model, we reverse the situation, assuming the Spouse is missing the expense. We use the resulting imputed expenses only to calculate a proportion based on the Financial Respondent's expense imputed from the first model and the Spouse's expense imputed from the second. We use that proportion to allocate the imputed household-level expense to each individual. The individually allocated amount is then summed with the out-of-pocket nursing home expense.

<sup>8</sup>Some Respondents report using a particular service (e.g., hospital stays), and insurance did not pay the full cost. However, when asked how much they paid out-of-pocket for that service, they give an amount of \$0. We treat these Respondents as "owners", since the costs may have been picked up by someone other than the Respondent.

<sup>9</sup>Again, we do not impute ownership for medical expenditures. See Section 3 for complete details on the Income and Wealth imputation methodology.

In addition to the estimate of the Respondent's total out-of-pocket spending, we also provide the imputed household-level amount (H2OOPMD). For some households, no uncovered expenses are reported, but some out-of-pocket medical expenses (excluding nursing home) are. These probably represent expenses for services not specifically asked about, such as durable medical equipment or over-the-counter drugs. If no uncovered expenses are reported, H2OOPMD is set to zero, even if some out-of-pocket expense is given. A second version of total out-of-pocket expenses is imputed without restricting the sample to those reporting an uncovered medical expense. This is included on the file as H2OOPMA.

### Exit Interview

Beginning with Wave 3, we impute out-of-pocket medical expenditures across all waves using the following method. If a Respondent's Proxy reports using a given service category and reports that insurance partially covered or did not cover costs for that category, we use the exact amount s/he reports.<sup>10</sup> For those who report using a given service but do not provide an exact amount, we impute an exact amount using bracketed responses. With two exceptions, the imputation algorithm for imputing complete brackets and exact amounts for out-of-pocket medical expenditures in the Exit Interviews is the same as the algorithm used for imputing complete brackets and exact amounts for income and wealth; it is described in detail in Section 3. As previously mentioned, we do not impute "ownership" for out-of-pocket medical expenditures.

The first difference between the out-of-pocket medical expenditures imputation process and the income and wealth imputation process occurs when we impute exact amounts for nursing home costs. Specifically, when the imputation methods for medical expenditures in the Core Interview data were developed, it was found that the tobit model we use for open-ended brackets in the income and wealth imputations fit the medical expenditures data poorly, and that nearest neighbor imputations better reflected the distribution. Therefore, the nearest neighbor is used for such cases in the medical expenditures imputation. We adopted this as well for the Exit Interview data.

The second difference is that we pool Exit Interview data across waves for the medical expenditure imputations. This is because there are naturally fewer Exit Interviews than Core Interviews. The pooled waves vary by the type of medical expenditure. Table 3 shows how the waves were pooled, as well as the types of medical expenditures available for each wave.

**Table 3. Exit Interview Imputation Pools and Types of Medical Expenditures by Wave**

Year	Wave	Medical Expenditure Type*									
		REMOPS	REMDENT	REMHOSP	REMNHM	REMHHC	REMSPEC	REMDR	REMDRUG	REMCHSP	REMOTHX
1995	3	Not Asked	Not Asked	Combined as REMHPNH		Combined as REMHCSP					
1996	3										
1998	4										
2000	5										
2002	6										
2004	7										
2006	8										
2008	9										
2010	10										
2012	11										
2014	12										
2016	13										
2018	14										
2020	15										

\*Out-of-pocket costs for outpatient surgery (REMOPS), dentist (REMDENT), hospital (REMHOSP), nursing home (REMNHM), hospital + nursing home (REMHPNH), home health care (REMHHC), special facilities (REMSPEC), home health care + special facilities (REMHCSP), doctor visits (REMDR), prescription drugs (REMDRUG), hospice (REMCHSP), and other medical expenditures (REMOTHX).

For example, in Waves 3-5, the surveys ask about out-of-pocket hospital and nursing home costs combined, whereas in Waves 6-9, they are asked as separate questions. Therefore, Waves 3-5 and Waves 6-9 are pooled for the associated imputations. The variables in the table above are available in the RAND HRS Detailed Imputations File, and are summed to create the two total out-of-pocket medical expenditure measures found here and in the RAND HRS Detailed Imputations File.

<sup>10</sup>Some Respondent's proxies report using a particular service (e.g., hospital stays), and insurance did not pay the full cost. However, when asked how much the Respondent paid out-of-pocket for that service, they give an amount of \$0. We treat these Respondents as "owners", since the costs may have been picked up by someone other than the Respondent.

The imputation model predictors are age at death, age at death squared, log of months since death, education, subjective health status at last live interview, gender, marital status, race, whether an individual had any long term care insurance, whether an individual had any Medicare coverage at time of death, Medicare coverage for doctor visits, Medicare prescription drug coverage, or Medicare supplemental coverage, whether an individual had any Medicaid coverage at time of death, whether an individual reported a hospital, hospice, or nursing home stay, number of doctor visits, and whether the hospital, nursing, or doctor visit data are missing. A zero value is assigned to each category where Respondents report not using a given service category or report that insurance fully covered all associated costs. Expenditures are then summed across service categories to calculate total out-of-pocket medical expenditures. The procedure produces an imputed value for out-of-pocket medical expenditures for all individuals in the sample, including those with missing data.

### **2.3.4.2 Total Medical Expenditures**

#### Core Interview

Questions about total medical expenditures are asked in Waves 3-6, but Respondents are only asked to estimate an exact amount in Wave 3H. For Wave 3H, we provide variables that contain the imputed amounts (R3TOTMD) and brackets (R3TOTMBI). For Waves 3A, and for Waves 4-6, there are no questions asking about exact total medical expenditures. Rather, all Respondents are directed into unfolding bracket questions. For these waves, we impute complete brackets when incomplete bracket information is provided (RwTOTMBI) using the imputation methods described above. However, since the HRS did not ask for the exact amount of total expenditures (except in Wave 3H), we cannot impute these amounts by the nearest neighbor approach. Instead, we estimate an ordered logit model, and impute based on the predicted value plus a random draw from the residual distribution, analogous to the approach that was followed for open-ended brackets in the Income and Wealth imputations. Beginning in Wave 7, questions about total medical expenditures are dropped from the survey.

#### Exit Interview

We do not create Exit Interview equivalents of the Core total medical expenditures variables (R3TOTMD/S3TOTMD, R3TOTMDF/S3TOTMDF, RwTOTMBI/SwTOTMBI, RwTOTMBF/SwTOTMBF).

## **2.4. Wages**

We construct wages using data on labor earnings and labor supply from the HRS Employment Section. This section focuses on the Respondent's main job. The HRS first asks Respondents whether they are currently working, unemployed, temporarily on leave, disabled, retired, or a homemaker. From individuals currently working for pay, the HRS asks to report normal hours per week and weeks per year worked on the main job. All individuals are asked whether they receive a regular salary, work by the hour, perform piecework, or get paid in some other manner. Regardless of the answer, they are then allowed to report their earnings from their main job in any interval they desire. That is, they can report their earnings as hourly, weekly, biweekly, monthly, yearly, or over some other interval. Self-employed individuals are also asked to report any profits they receive from their main job.

The RAND HRS Longitudinal File contains both hourly and weekly wages. Hourly are stored in variables RwWGIHR; weekly wages in RwWGIWK. We scale reported earnings up or down to arrive at hourly and weekly wages as necessary. For example, if a Respondent reports an hourly wage then we assign that as their hourly wage and multiply it by reported hours worked per week to calculate the weekly wage. Individuals reporting a weekly wage are assigned that as their weekly wage and their weekly wage divided by hours worked per week as their hourly wage. We include both hourly and weekly wages in the data so that a wage rate is available even if hours worked per week is missing. Annual wages are scaled down in a similar fashion by annual number of weeks worked. We assume that biweekly and monthly wages represent wages for two and 52/12 weeks, respectively. We treat self-employed profits identically to earnings. Flag variables indicate whether the wage rate is self-reported, derived from self-employed profits, or imputed (see below). We do not include overtime wages in our figures. All wages are reported in nominal dollars.

The wage rate variables are missing for individuals who are out of the labor force or who did not provide sufficient information to calculate an hourly or weekly wage. Out of the labor force includes retired, disabled, on temporary leave, and homemakers. Missing rates increase as the number of retirees increase but decrease at the waves in which a new, younger cohort is added (Waves 4, 7, 10, 13). The means and medians of these calculated wages appear to be within reason across waves and are consistent with labor income reported in the assets and income section.

We impute wages for the unemployed. We use two methods for imputing such wages. First, the unemployed are asked to report the wage on their last job since the previous interview. If available, we use that wage as the current wage. If not available, we take the wage reported in the previous wave. If that wage is not available either, we proceed backwards through successive waves until we find a valid wage for that individual. This includes using information from the individual's Wave 1 job history file, if necessary. The prior wage is then adjusted to the current interview year using CPI-U. This method produces an imputed wage for approximately 90 percent of unemployed individuals. For the remaining unemployed, we predict wages from the full sample using a regression of (the logarithm of) wages on age, age-squared, education, race, marital status, whether unemployed in any wave, and Census region of residence. We include flag variables (RwWGFHR for hourly and RwWGFWK for weekly wages) to indicate whether a wage rate was imputed, and which imputation method was used.

## 3. Income and Wealth Imputations

### 3.1. Background

The RAND HRS data contain a number of income and wealth variables. Where missing, we impute their values. In this section, we give an overview of the question sequences and imputation methods. A detailed technical description can be found in Hurd, Meijer, Moldoff, and Rohwedder (2016).<sup>11</sup>

Most HRS and AHEAD questions on wealth and income follow the same pattern. Consider holdings of stocks and mutual funds as an example. First, the interviewer asks whether the Respondent (or their spouse or partner) owns any shares of stock or stock mutual funds. If affirmative, the interviewer asks the value of these stock holdings. If the Respondent is unable or unwilling to provide an exact amount, the interviewer asks whether it is more than \$25,000. If the answer is "more than \$25,000," the interviewer asks whether it is more than \$125,000, whereas if the answer is "less than \$25,000," the interviewer asks whether it is more than \$2,500. Depending on the responses, the ranges are narrowed down to \$0-2,500; \$2,500-25,000; \$25,000-125,000; \$125,000-400,000; \$400,000 or more. These ranges are known as "brackets," and the sequence of probes into increasingly narrow ranges are known as "unfolding brackets" questions. The brackets vary by asset and income category, and the cut-off values (also known as thresholds), though generally stable, can change between waves. For example, the cut-off values for dividend and interest income in HRS 1994 (Wave 2H) are \$200, \$500, \$2,500, and \$10,000, while in HRS 1996 (Wave 3H) they are \$1,000, \$5,000, and \$25,000.

The Respondent may opt out of the question sequence at any time. As a result, the raw data contain valid zero-value responses, exact amounts, complete bracket responses, incomplete bracket responses, claim of ownership without any information about the value, and unknown ownership. (We also use the term "ownership" to indicate whether a household or individual receives a certain kind of income or holds a certain kind of debt.) An incomplete bracket results if the Respondent provided some information about the value, but was unable or unwilling to respond through the last unfolding bracket probe. For example, if the Respondent indicated that the stock holdings amount to more than \$25,000, but did not say whether they are worth more than \$125,000, the range is an open-ended bracket of \$25,000 or more. A claim of ownership without value results if the Respondent indicated that s/he owns stocks, but revealed neither the exact amount nor a range. A claim of ownership without value is a special case of an incomplete bracket, namely an open-ended bracket of greater than \$0.

As an illustration, Table 4 shows the frequency distribution of response types on the ownership and value of stock holdings in HRS 1994 (Wave 2H). The stock holdings question is asked of the Financial Respondent in the household, and the unit of observation in the table is a household. The majority of Financial Respondents, 68.1 percent, report not owning any stocks (other than in retirement plans, which are not covered by this question). About one-fifth, 20.3 percent, own stocks and provide an exact value. All other categories require imputation.

<sup>11</sup>Hurd, M. D., E. Meijer, M. Moldoff, and S. Rohwedder (2016). Improved wealth measures in the Health and Retirement Study: Asset reconciliation and cross-wave imputation. Santa Monica, CA: RAND Corporation, Center for the Study of Aging. ([http://www.rand.org/pubs/work\\_ing\\_papers/WR1150.html](http://www.rand.org/pubs/work_ing_papers/WR1150.html))

**Table 4. Distribution of Response Types on Stock Holdings (HRS 1994)**

<b>Response Type</b>	<b>Frequency</b>	<b>Percent</b>
Continuous value	1,431	20.3
Complete bracket	487	6.9
Incomplete bracket	34	0.5
Owens, no value/bracket	111	1.6
No asset	4,803	68.1
Don't know ownership	66	0.9
No Financial Respondent	119	1.7
<b>Total</b>	<b>7,051</b>	<b>100.0</b>

Note the last category in Table 4 "No Financial Respondent." These are cases in which the HRS, for whatever reason, did not interview a Financial Respondent.<sup>12</sup> For those cases, virtually nothing is known about financial issues. The RAND HRS data contain imputed values for these households, but the user should be aware that these imputations are subject to potentially large errors. They may be identified through flag variables. For example, Table 4 is derived from variable H2AFSTCK ("H2AFSTCK:W2 Asst Flag:Stocks").

In summary, the data contain valid responses and several types of responses that require imputations. In decreasing order of informational content:

- Case 1: We may know a "complete" range of values;
- Case 2: We may know that the household owns the asset (or has the income type), but have no information on its value, or only coarse information in the form of incomplete brackets; or
- Case 3: We may not even know whether the household owns an asset, much less its value.

### 3.1.1. Alternative Question Sequences

While the majority of income and asset questions follow the pattern described above, there are deviations.

Some questions, particularly income questions in HRS 1992 (Wave 1), do not probe for brackets if the Respondent is unable or unwilling to provide an exact amount. In the data, we classify missing responses in these cases as if there were unfolding bracket questions, but the Respondent refused to provide any range information, i.e., as Case 2 above.

Some interviewers in Wave 1 used so-called range cards instead of the sequence of unfolding bracket questions. This was especially prevalent for questions on the value of primary residence, mortgages, home loans, equity lines of credit, and debt. The range cards contain a list of ranges. For example, a card may have shown \$0-100; \$100-500; \$500-1,000; \$1,000-5,000; \$5,000-10,000; \$10,000 or more. The cards were intended for other purposes but were sometimes used inadvertently when Respondents were unable or unwilling to provide an exact amount.<sup>13</sup> Respondents who were presented a range card had instant knowledge of all cut-off values, as opposed to gradual access in unfolding bracket questions. The cut-off values on the range cards were typically different from those in the appropriate unfolding bracket sequence. We treat responses from range cards in the same way as complete brackets, i.e., Case 1 above. Naturally, we account for the cut-off values on the range cards, even if they are different from those in the unfolding bracket sequence.

Starting in HRS 1998 (Wave 4), the "entry point" of the unfolding bracket sequence was randomized in questions about assets. In other words, Respondents who were unable or unwilling to provide an exact amount were asked whether the value was more than a certain value, where that value varied across Respondents. The underlying idea was to reduce any response bias that may arise from

<sup>12</sup>In some households, a Financial Respondent was designated, but in fact provided no financial data, perhaps due to a partial interview that ended before the main financial section of the survey was conducted. For some of these cases, house and mortgage information may have been provided but no other wealth or income data was collected in the main income and wealth section which follows the housing section in the survey instrument. For imputation of income and non-housing wealth, cases missing the entire section of financial data are treated as though there is no Financial Respondent.

<sup>13</sup>The Wave 1 interview was face-to-face; subsequent interviews were conducted mostly by telephone. For all subsequent waves, interviews with Respondents 80 years of age or older, as well as initial interviews (for all cohorts and new cohorts), are also conducted face-to-face. Starting with the HRS 2006 wave, about half of the sample is interviewed face-to-face (to facilitate the collection of additional content), and half is interviewed by telephone.

the value of the entry point ("acquiescence bias"). We ignore the fact that the entry point varied across Respondents and process the resulting information in the same way as in previous waves.

Also starting in Wave 4, interviewers were able to record a new response. For example, suppose the interviewer asked "Is the amount greater than \$5,000, less than \$5,000, or what?" The potential answers now are "less than \$5,000," "about \$5,000," and "more than \$5,000." In earlier waves, the second response was combined with the first or third response. The additional option is present at each subsequent branch. Where the Respondent indicates that the amount was "about" equal to a certain value, we take that value as an exact response and do not impute anything. However, this is still classified as a complete bracket in the imputation flag variable and not as a continuous amount. We treat range responses in the same way as those in earlier waves.

Finally, some cut-off values of specific asset and income questions changed between waves, as did the entry point. In addition, the way unfolding bracket information is presented in the raw data changes over time, from variables representing the "yes/no" questions through Wave 5, to variables summarizing them as a "minimum/maximum" of the range in Wave 6 forward. This did not affect the resulting response types.

### 3.2. Imputation Process

The HRS public release files provide imputations for many asset and income types in earlier waves, but the imputation method is not consistent across all waves, and there are no imputations in more recent waves. The RAND HRS data contain imputations of all asset and income types using a consistent method for all waves. The RAND HRS Longitudinal File contains aggregate measures of income and assets. The RAND HRS Detailed Imputations File is a more complete and detailed file, containing all partial component imputations in addition to the aggregate measures, and is available on the [HRS website](#).

As defined previously, there are three types of missing values that require separate types of imputation. Correspondingly, we have developed three progressive imputation steps: to impute an exact amount, given that a range is known; to impute a range, given that ownership or only incomplete range is known; and to impute ownership, in case nothing is known. Table 5 illustrates the type of imputation necessary for each type of missing value.

The imputation process is progressive in the sense that we first impute ownership for those for whom nothing is known. Given ownership, we impute brackets. Given brackets, we impute exact amounts. We always use all available information. In particular, where incomplete brackets are known, we impute complete brackets in the given range.

**Table 5. Response Types and Required Imputations**

<b>Reported Information</b>	<b>Required Imputation</b>
Continuous value	None
Complete bracket	Amount
Incomplete bracket	Bracket, Amount
Owns, no value/bracket	Bracket, Amount
No asset	None
Don't know ownership	Ownership, Bracket, Amount
No financial Respondent	Ownership, Bracket, Amount

### 3.2.1. Ownership Imputation

To impute ownership, we first estimate a logistic regression model of ownership based on the sample of Respondents with non-missing ownership information for the asset or income type at issue. The covariates are discussed below. Next, we calculate the predicted probability of ownership for households with missing ownership information. Finally, we draw a random number from a uniform distribution between zero and one. We impute ownership if the predicted probability exceeds the random number and non-ownership otherwise.

The estimation sample varies by asset and income type. For example, a household that reports whether they own their primary residence, but does not report whether they own stocks or mutual funds, enters the estimation sample for ownership of the former, but not the estimation sample for ownership of the latter.

In some waves and for some asset and income types, ownership is rare and the logistic regression model fits the data poorly. Instead of imputing on the basis of a logistic model, we randomly assign ownership with a probability of ownership found in the nonmissing sample. This is equivalent to fitting a logistic model without covariates. We apply this procedure for assets in waves with fewer than 50 households reporting ownership.

### 3.2.2. Bracket Imputation

We impute brackets for asset owners and income recipients (imputed and reported) who do not report a continuous value and do not fully complete the questionnaire bracketing sequence on asset or income value. First, we estimate an ordered logit model based on the sample of households who do not report a continuous value but do complete the bracketing sequence. The covariates are discussed below. Next, we calculate the predicted probabilities of being in each bracket for Respondents with missing or incomplete bracket information. For those who partially complete the bracketing sequence, we calculate conditional probabilities based on the range of possible values from their answers. Finally, we draw a random number from a uniform distribution between zero and one and assign a bracket based on a comparison of the random number with the cumulative distribution of range probabilities.

For some asset and income types, notably Wave 1 incomes, no bracket questions were asked. For these items, this step is skipped and we treat the strictly positive dollar range as a single large open-ended bracket.

Beginning in Wave 4, those households who do not report a continuous value at the first opportunity but do give an "about" response during the unfolding bracket sequence of questions are included in the logit model. Probabilities are then estimated for being in each bracket and each cutpoint value. Households imputed to one of the cutpoint values need no amount imputation for that particular component.

For some asset and income types, fewer than 50 households completed the bracket sequence in a certain wave. If this is the case, we follow the same strategy as with rare ownership. That is, we impute the bracket using only the marginal probabilities and no covariates. In some rare cases, there is not even enough information in the marginal probabilities, and we skip the bracket imputation and impute amounts directly. This happens when only one complete bracket range is reported (so this would otherwise get probability 1), or when the incomplete bracket range reported is completely outside the range of the reported complete bracket ranges.

### 3.2.3. Amount Imputation

We impute exact amounts for all cases with (reported or imputed) bracket information. The procedure is different for cases in closed vs. open-ended brackets.<sup>14</sup> For closed brackets, we use a "nearest neighbor" approach; for open-ended brackets, a tobit-based approach.

In the nearest neighbor approach for closed brackets, we first estimate a linear regression model based on the sample of households who report an exact continuous value. The covariates are discussed below. The distribution of asset and income amounts tends to be roughly lognormal, so we would like to apply a logarithmic transformation to the outcome (asset, income) variable. However, some outcomes, such as business income, may be negative. The frequency with which this occurs is very low - too low to allow for a fully flexible model specification.

<sup>14</sup>A closed bracket has finite cut-off values; an open-ended bracket is, for example, \$500,000 or more, so the upper limit is infinite.

Instead, we therefore apply the inverse hyperbolic sine transformation<sup>15</sup> and use this as the dependent variable. Next, we compute predicted values for all cases, both with and without exact amounts. For each missing observation in a closed bracket, we find the household that is closest in *predicted value*, among the households that report an exact amount within that bracket. This is the nearest neighbor. We then impute the actual value reported by the nearest neighbor.

For some asset and income types, fewer than 50 households reported a continuous value in a given wave. In this case, instead of a nearest neighbor from a regression model, a donor household is found using a conditional hotdeck procedure. This can be viewed as a nearest neighbor method without covariates, but because there are multiple households that are equally near (i.e., they all gave continuous answers that fall in the given bracket), one is chosen at random.

Another exception is that sometimes there are not enough donors in the given bracket, where we define "not enough" as being less than two observations. In this case, a value within the bracket is imputed from a lognormal regression model. This is similar to the tobit procedure discussed below, but includes all positive values in the estimation.

In exploratory work, we applied the nearest neighbor method to missing amounts in both closed and open-ended brackets. However, we found that the resulting imputations generated implausible distributions at the top of the distribution. The data contain some outliers which the nearest neighbor approach selects with too high a frequency to be plausible. We therefore developed an alternative approach for open-ended brackets.

For missing observations in open-ended brackets, we estimate a separate model. In essence, we estimate a lognormal regression model. However, as indicated above, the observed distributions differ from the lognormal distribution because there occasionally are negative values, and in general the smaller observed values do not fit the lognormal distribution as well. But we only use this model for imputing values in the upper bracket, so the goal is to approximate the right tail of the distribution closely. Therefore, we first censor observations in the bottom 25 percent of the outcome variable. That is, we keep the information that they are less than the 25th percentile, but not the actual values. This ensures that the values used in the estimation are all positive and that their distribution is close to (censored) lognormal. Based on this sample of non-missing observations, we estimate a censored regression (tobit) model. The covariates are discussed below. The dependent variable in this model is a logarithmic transformation of the actual amount, and the residuals on this scale are assumed to be normally distributed and homoskedastic. We then compute predicted values of the log-amount for missing observations. To preserve the spread of the distribution of outcomes in the imputations, we add a draw from the residual distribution to this log-amount, and then untransform (exponentiate) the result. The residual distribution is assumed to be normal (with a zero mean and a standard deviation equal to the estimated standard deviation of the residual in the tobit regression model), but truncated from the left to ensure the resulting value is in the top bracket. Note that this truncation point is higher than the censoring point used in the estimation.

For some asset and income types, fewer than 100 households report a continuous value in certain waves.<sup>16</sup> If this is the case, we follow an analogous strategy as with rare ownership and completed brackets. That is, we impute the value using only the marginal distribution and no covariates, where the marginal distribution is a truncated lognormal distribution. We have implemented this by

<sup>15</sup>The inverse hyperbolic sine transformation is given by  $y = \ln(Y + \sqrt{Y^2 + 1})$ . For positive values of outcome  $Y$ , not close to zero, this transformation closely mimics the logarithmic transformation. Only for small amounts, on the order of between  $-\$10$  and  $+\$10$  is the transformation appreciably different from the logarithmic transformation. The transformation is point-symmetric around zero. It may be graphed as:

If the logarithmic transformation were added to this graph, it would be indistinguishably close on the north-east quadrant (up to a scale factor).

<sup>16</sup>We use 100 here rather than the 50 used for the other models, because the estimates of the tobit models with covariates were still unstable with sample sizes between 50 and 100.

estimating the aforementioned tobit model, but omitting the covariates and imputing the value accordingly.

When using the tobit imputation method without upper bound, the imputation algorithms will sometimes produce amounts that are unrealistically large. To avoid imputing such outliers, the tobit method as implemented (with a very small number of exceptions) uses the 99.5th percentile of the distribution of the reported amounts as the upper bound. We have found that this reflects the observed distribution well, while avoiding large amounts similar to reported outliers. Note that outliers in the reported data are not changed, and users have to decide how to handle them.

### 3.2.4. Covariates

The number of model specifications in the imputations is large. There were four waves of data when these methods were initially developed, with well over a dozen asset and income types, and each requires four equations. We have experimented extensively with model specifications. On the one hand, we would like to select covariates that predict the outcome variables best. On the other hand, we would like the specifications to be parsimonious and consistent across asset and income types. Consistency across asset and income types has caused problems with those for which only small samples are available. In the end, we have opted for the same set of covariates in all asset model specifications (ownership, bracket, and amount for all asset types) and another set in the income specifications. The sets are formed by principal components of approximately 30 underlying covariates. For income imputations, the underlying covariates include (transformations of) husband and wife's employment status, education, health status, age, race, marital status, occupation class,<sup>17</sup> cognition, and bequest expectations. For wealth imputations, the same set applies, but excludes employment status and includes a number of income amounts (imputed, when necessary) and indicators of pension or government benefit receipt. We have found that using the first ten principal components results in model fits that in most cases are very close to the fit from the larger set of covariates, with very few sample size issues. (The previous sections have explained what we do in cases where there are sample size issues.) The set of regressors varies slightly across waves, and the principal component loadings are computed separately for each wave. For example, Table 6 shows summary statistics and loading of the covariates that make up the principal components of the Wave 2 income imputations.

The imputations using this set of covariates should be satisfactory for many purposes. Comparisons of the resulting distributions of income and assets with distributions from external sources (e.g., asset distributions from the Survey of Consumer Finances) indicate that the distributions match well. If they differ substantially from distributions in other surveys, the distributions in the HRS often seem to be more plausible. However, the imputations are sometimes less satisfactory for analyses of longitudinal patterns, especially for asset changes between waves. In particular, when a household reports a "no value/bracket" or "don't know ownership," this method may lead to large changes between waves, more than is to be expected in the population, because the method does not take the correlation (or persistence) across time into account. Therefore we provide cross-wave imputations of asset variables, which take information from adjacent waves into account.

<sup>17</sup>Beginning in Wave 8 (2006), HRS changed the coding of occupation from the 1980 U.S. Census Occupation Codes to those for 2000 (a supplemental file has since been released for Wave 7 (2004) that uses the 2000 U.S. Census Occupation Codes as well). One of the covariates we use in the imputation process is an indicator for whether or not a person's occupation is defined as "professional" (See Table 6, M\_PROF and F\_PROF). The 1980 codes were collapsed into 17 categories, and determining who was professional was relatively straightforward (See JMW201AM in the HRS 2004 codebook for a list of these categories). Specifically, we defined professionals as anyone in the first two categories (i.e., "Managerial specialty operation," or "Professional specialty operation and technical support").

The 2000 U.S. Census Occupation Codes were used for Wave 7 (2004) to Wave 10 (2010) (a supplemental file has since been released for Wave 10 that uses the 2010 Census Occupational Classification System as well). The 2000 codes were collapsed into 25 categories, which were quite different from the 17 categories produced using the 1980 codes. We determined that the first 11 categories could appropriately be considered professional occupations (see KMW201AM in the HRS 2006 codebook for a list of these categories).

The 2010 Census Occupational Classification System was used for Wave 10 (2010) and beyond. The 2010 codes were collapsed into 23 categories, and are not that different from the 25 categories produced using the 2000 codes. Therefore, the first 10 categories were considered professional occupations (see NMW201AM in the HRS 2012 codebook for a list of these categories). In the end, we evaluate all of the information described above regarding occupation when deriving the "professional" covariate.

**Table 6. Loadings on the First Two Principal Components  
(Wave 2 Income Imputations)**

Variable	Mean	Std. Dev	Loadings on		Description

The cross-wave imputations add a few covariates to the models: In addition to the 10 principal components, we include the (inverse hyperbolic sine of) the value of the asset in the previous wave and the (inverse hyperbolic sine of) the value of the asset in the next wave. If there is a strong persistence in asset values over time, including these past and future values should capture this, and lead to imputations that show smoother patterns across time. If in the adjacent wave, the asset is not owned, we include zero as its value, and we include dummies for whether the household owns the asset in the previous and next wave. Changes in marital status (where we treat cohabitation the same as marriage, as is usual in the HRS) have potentially large effects on wealth, and wealth changes should be less smooth. Therefore, we also include a set of dummies for such changes: divorce or separation, death of the spouse/partner, or remarriage/new partnership. There is one set for changes between last wave and the current wave and one set for changes between the current wave and the next wave. See Hurd et al. (2016) for details of the definitions.<sup>18</sup>

If the household does not report a continuous value (or a no asset response) in an adjacent wave, we have a missing covariate, and thus we cannot impute the value for the current wave. To solve this problem, we first compute cross-sectional imputations (i.e., without the cross-wave information) for each household, and then use the cross-sectional imputation of the adjacent wave as the covariate in the current wave. However, for households for which we have no adjacent wave information, this still does not solve the issue. This happens when a household enters the sample (the first wave a cohort is entered); in the latest wave; or when a household does not participate in a wave. For imputing these cases, we use imputation models that include the cross-wave information from only

<sup>18</sup>Hurd, M. D., E. Meijer, M. Moldoff, and S. Rohwedder (2016). Improved wealth measures in the Health and Retirement Study: Asset reconciliation and cross-wave imputation. Santa Monica, CA: RAND Corporation, Center for the Study of Aging. ([http://www.rand.org/pubs/work\\_ing\\_papers/WR1150.html](http://www.rand.org/pubs/work_ing_papers/WR1150.html))

the previous wave or only the next wave, whichever is applicable. If neither previous nor next wave information is available for a household, we use the cross-sectional imputation.

In principle, all imputation models are wave-specific. That is, principal components are computed for each wave separately, and coefficients of the covariates in the imputation models are computed for each wave separately. However, the number of marital status changes is typically too small to estimate the coefficients of these dummies with enough precision in each wave separately. Therefore, we use all waves jointly to estimate these coefficients. That is, we estimate wave-specific coefficients for all covariates except the indicator variables for the change in marital status.

### 3.3. Asset Verification

After a successful experiment in 2001, described in Hill (2006)<sup>19</sup>, the HRS added the *asset verification* section (section U; also called *asset reconciliation* section) to the questionnaire in 2002. Whenever there is a large discrepancy, defined as more than \$50,000, between an asset value in the previous wave and the value of the same asset in the current interview, the Respondent is asked to verify, or correct when necessary, the asset values in the previous and current wave. The idea behind this is that large changes in asset values are rare and therefore, if we see them in the data, there may have been a reporting error or data entry error which we want to correct. The Respondent is only asked these verification questions if the same (Financial) Respondent reported the asset in both waves and total wealth differs by more than \$150,000. The former is for disclosure reasons and the latter is to avoid flagging portfolio rebalancing (e.g., selling stocks and buying bonds instead).

In HRS 2002 and HRS 2004 (Waves 6 and 7), Respondents were asked about at most three assets in the asset verification section. From 2006 onward, Respondents could potentially be asked about all assets that were checked in this section, although it does not happen often that a Respondent is asked to verify more than a few assets. There are other changes between waves, for example in the preloaded information from the previous wave and how it is used. See Hurd et al. (2016) for the details.<sup>20</sup>

The RAND wealth measures take corrections from the asset verification section into account. These corrections precede the imputations. First, corrections for the current wave are implemented. Then, corrections of the previous wave's value are evaluated. If the asset is not asked about in the previous wave's asset verification section, then we implement the correction of the previous wave's value. If the asset is also asked about in the previous wave's asset verification section, we generally use the result from the previous wave's asset verification section (the contemporaneous one). However, we inspect all cases where the results from the previous wave's asset verification section and the current wave's asset verification section differ by more than a factor of 9 to catch gross errors, in particular accidental errors in the number of zeros.

The corrections from the asset verification section occasionally lead to some complications, such as inconsistent data that cannot occur in the main questionnaire because of skip patterns and complications with the implementation of the imputation methods. An example of the former is that the main questionnaire has a branch of questions in case the primary residence is a mobile home, and another branch of questions if it is another type of dwelling. In some cases the corrections from the asset verification section lead to the household having a number in both branches. We check all such cases and determine what is the most reasonable way to interpret the data and then make it consistent with the logic of the main questionnaire. An example of a complication with the imputations is where unfolding bracket thresholds are not always the same. See Hurd et al. (2016)<sup>21</sup> for the details and how we dealt with these issues.

<sup>21</sup>Ibid.

### 3.4. Substantive Differences Across Waves

In addition to survey-technical changes between waves and the introduction of the asset verification section, there have been a few changes that may affect the comparability of asset values across waves. We discuss the most important changes here.

#### **Notable Differences between Waves HRS 1992 (Wave 1) and HRS 1994 (Wave2)**

*Net value of vehicles:* Wave 1 includes a measure of the value of a recreational vehicle or motor home in the Housing Section and a measure of the value of other vehicles in the Asset Section. We separately impute these values and sum them. Starting in Wave 2, the two components are incorporated into one measure of the net value of vehicles in the Asset Section.

#### **Notable Differences between HRS 1994 (Wave 2) and HRS 1996 (Wave 3)**

*Asset income:* In Waves 1 and 2, asset ownership and value are asked in the Asset Section, whereas income from assets is asked separately in the Income Section. Starting in Wave 3, income from asset questions were incorporated in the Asset Section. For example, if the Respondent indicated owning stocks, the interviewer followed up with a question about dividends. This increased the response rate for asset income. Assuming that this increases the quality of responses, it also improves the accuracy of our asset imputations, because asset income is an explanatory covariate of our wealth imputation model.

*Net value of IRA/Keogh accounts:* In Waves 1 and 2, Respondents were asked to report the total value of all Individual Retirement Account (IRA) and KEOGH accounts. Starting in Wave 3, separate questions were asked about the largest, second largest, and all other accounts.

#### **Notable Differences between HRS and AHEAD (Waves 2 & 3)**

##### *HRS 1994 and AHEAD 1993 (Wave 2)*

AHEAD 1993 has a very different structure than HRS 1994. With the exception of Social Security benefits, SSI and food stamps, Respondents are expected to specify the types of income received. For example, they are asked if they have "any regular income," and if so, they are asked to identify the source. So there are no specific questions such as "Do you receive any income from pensions?" However, they can describe up to 4 regular incomes per partner, and up to 3 household investment incomes. The result is many separate components for those combined in other waves, such as stock income and veterans' benefits. Specific question wording differences are described in the "Cross-Wave Differences in Original HRS Data" subsections in the codebook.

##### *HRS 1996 and AHEAD 1995 (Wave 3)*

The structures of HRS 1996 and AHEAD 1995 are very similar. However, there are several notable differences. These are outlined under the "Cross-Wave Differences in Original HRS Data" subsections in the codebook.

#### **Notable Differences between HRS 1998 (Wave 4), HRS 2000 (Wave 5) and HRS 2002 (Wave 6)**

The structures of Waves 4, 5, and 6 are very similar. Any important differences are specified under "Cross-Wave Differences in Original HRS Data" subsections in the codebook.

#### **Notable Differences between HRS 1998 (Wave 4) through HRS 2002 (Wave 6) and HRS 2004 (Wave 7) and later**

The structures of questions from Wave 7 forward are very similar to those in Waves 4 to 6. However, Waves 7 and

later no longer ask for income from trusts and alimony specifically. One can assume that these types of income would now be reported with non-specific other income. We have looked at this for cases that previously did report alimony or trust income, and found that other income did not increase as one might expect.

#### **Notable Differences between HRS 2000 (Wave 5) and HRS 2002 (Wave 6) and later**

In Wave 5, Respondents who are 65 years of age or older and report not working for pay in the last calendar year skip the questions about income from unemployment and worker's compensation. Respondents who are younger than 65 years of age, on the other hand, are asked both sets of questions even if they are not working. From Wave 6 onward, the same pattern is true for Respondents who are 65 years of age or older. However, those who are younger than 65 years of age and report not working for pay in the last calendar year are asked the questions about income from unemployment but skip those related to worker's compensation.

#### **Notable Differences between HRS 2006 (Wave 8) and HRS 2008 (Wave 9) and later**

*Business assets reported earlier in the interview:* Beginning in Wave 6, after the value of business or farm assets is collected, a question (Q492) asks whether these assets were reported previously in the interview. Beginning in Wave 9, a follow-up question was added which asks Respondents to indicate what percentage was previously reported (Q523). For example, in Wave 9, about 30% of business owners indicate that they had reported their business wealth as either primary residence (which could be a farm or ranch), secondary residence, or other real estate earlier in the interview (Q492 = yes), and of these, most say that all of the business asset was previously reported (Q523 = 100%). These two variables are available in the RAND HRS Detailed Imputations File for the convenience of the analyst and can be used for adjusting total wealth to reflect the amount of wealth that is twice reported. We do not use these two variables in the imputations or derivations of any of the variations on total wealth.

*Housing loan question wording:* In the housing section, there is a series of questions about whether the Respondent has "...a mortgage, land contract, second mortgage, or any other loan that uses the property as collateral." In Wave 9, the qualifier "Do not include reverse mortgages" was added.

#### **Notable Differences between HRS 2008 (Wave 9) and HRS 2010 (Wave 10) and later**

*Food stamps:* The questions asking about number of months receiving food stamps changed in Wave 10. Specifically, questions are only asked for up to four "eligible years." Those are the years spanning the range of a Respondent's current interview and previous interview (or the previous wave year if Respondent was not interviewed). For example, a person interviewed in 2008 and 2011 is asked questions about food stamp receipt in 2008, 2009, 2010, and 2011. Prior to Wave 10, Respondents can report on food stamp receipt for several years prior to the current interview year.

*Income from annuities:* Beginning in Wave 10, Respondents who report receiving income from annuities, but a value of "0" is indicated for the amount received last month (which indicates that payments have not started yet, or the Respondent did not receive a payment last month) are asked a new sequence of questions about any income they may have received from those annuities last year. Similar questions are asked of spouses/partners. No unfolding bracket questions are asked.

## 4. Poverty Threshold Definitions and HRS Measures

The RAND HRS Longitudinal File includes several measures of poverty for all waves. We use the [poverty threshold levels from the U.S. Census Bureau](#)<sup>22</sup> and family composition to determine the poverty threshold that applies to an HRS family. We then compare the HRS family income to the appropriate poverty threshold. The [methods used by the U.S. Census Bureau to measure poverty](#) are normally applied to CPS data to arrive at national poverty rates. The two key definitions for applying these methods to HRS families are income and family composition.

The family composition depends on the number of resident family members, the number of these less than 18 years old, and the age of the head of household in one or two-member households. People in the military or in institutions like nursing homes or prisons are not included when counting resident family members.

Income includes before-tax income from:

- earnings, unemployment benefits, workers' compensation
- SSI, public assistance, veterans' benefits
- Social Security (for Respondents who had Medicare Part B and/or Part D premiums deducted from Social Security payments, we add these premiums back in to obtain Social Security income before deductions)<sup>23</sup>
- pension and retirement income
- interest, dividends, rents, royalties, income from estates and trusts
- educational assistance
- alimony, child support
- assistance from outside the household
- other sources
- income of all resident family members

Income does not include:

- noncash benefits, e.g., food stamps
- capital gains and losses

We assume that educational assistance and other sources would have been reported as "other income" in the HRS, but it is likely that at least some assistance from outside the household may not be included in any of the HRS income categories.<sup>24</sup> The HRS total household income, e.g., as calculated in HwITOT on the RAND HRS Longitudinal File, less food stamps, and including Medicare Part B and/or Part D premiums deducted from Social Security, would seem to be close to the Census definition of income, with the exception of income from resident family members besides the Respondent and spouse. Note that RAND HRS total household income is for the last calendar year, e.g., 2001 for income reported at the 2002 interview

<sup>22</sup>The federal poverty guidelines, also known as the federal poverty line or federal poverty level (FPL) are related but slightly different from the poverty thresholds as provided here. The thresholds are defined by the U.S. Census Bureau. They are intended for statistical purposes. The guidelines are derived from these by the U.S. Department of Health and Human Services. They are used to determine eligibility for federal programs such as Medicaid. See, for example, <https://aspe.hhs.gov/topics/poverty-economic-mobility/poverty-guidelines/frequently-asked-questions-related-poverty-guidelines-poverty> and <https://www.healthcare.gov/glossary/federal-1-poverty-level-fpl/> for more information.

<sup>23</sup>For historical information regarding Medicare Part B premiums, see <https://fas.org/sgp/crs/misc/R40082.pdf>. According to Medicare rules, Medicare Part B premiums depend on modified adjusted gross income (MAGI). The HRS survey instrument elicits income before taxes and deductions. As an approximation, we use HwITOT minus food stamps. For details about how we process Medicare Part B and Part D premiums, please see the "Poverty Threshold" section later in this document, as well as "Section C: Medicare Part B and Part D Premiums" in Appendix A.

<sup>24</sup>The HRS question wording for "other income" specifically excludes income from family and friends. The Census definition of assistance from outside the household indicates that this includes "periodic payments people receive from non-household members. This type of assistance excludes gifts or sporadic assistance." HRS questions on income transfers from children do not specify whether the amounts are periodic or sporadic, so we have decided not to include these in the income used to determine the poverty threshold.

and 2003 for income reported at the 2004 interview.

Questions ask about the income of resident family members, including the earnings of each and total non-job income of them all. With these questions, we can estimate income of all resident family members, which is not included in HwITOT.

#### 4.1. Method

We construct a poverty status variable to be consistent with that produced using the Census definitions, within the limitations of the HRS data, as follows:

1. Make household resident observations from the work and earnings questions, identified by sub-household ID and OPN.<sup>25</sup>
2. Merge with the household member/child roster.<sup>26</sup>
3. Keep people who are resident and related to the Family Respondent (FamR) or spouse. This includes current relations (codes=3-19, 28, 33, 35, 36, 90, 91) who have a status code indicating residency (=1) or temporarily away (=2 or 3).<sup>27</sup> Please see "Summary of Data Issues" later in this section for a discussion of residents who are away, and income year versus residence year.
4. Impute non-core household member income, including earnings and non-job income. The method used for these imputations is described below ("Imputing Household Member Income").
5. Count number of residents and residents under 18<sup>28</sup> by sub-household.
6. Merge with core data, including imputed income, whether a couple, and age(s) of Respondents.
7. Adjust the number of household members by the number of core HRS members in the family (one or two).
8. Assign family to a Census category to retrieve the appropriate poverty threshold. Use age of the only, or male, non-institutionalized HRS Respondent to determine if head is 65 or older in one- or two-person households.<sup>29</sup> The family category is provided on the file, as is the corresponding poverty threshold.
9. Adjust family income. The adjusted family income is provided on the file.
  - (a) Starting with HwITOT, subtract food stamps, and add Medicare Part B and/or Part D premiums for cases where these had been deducted from reported Social Security payments.
  - (b) Add in earnings for all non-core residents.
  - (c) Add in total non-job income for non-core family residents.

<sup>25</sup>In Waves 2A and 3A, and in Waves 3H to 5, earnings information for household members and their spouses are captured on the same record (i.e., if a household member has a spouse, the spouse is not assigned their own OPN). Therefore, we perform an intermediate step prior to imputation to create separate records for spouses and assign key demographic information about them where possible.

<sup>26</sup>There are some household residents from the income section who do not appear on the roster. Since we cannot determine the relationship for these people, we drop their income and do not count them as resident family members.

<sup>27</sup>We assume the household member is non-resident if the status code is missing, and non-family if the relationship code is missing. Additionally, the relationship codes listed here are for Wave 6 forward. Prior to Wave 6, there are significantly fewer codes, with the exception of Waves 1 and 2H, which have detailed codes for both relatives and non-relatives. We map these codes to those used in Wave 6 forward prior to imputation.

<sup>28</sup>If the birth year of a resident family member is missing we use logical imputation to determine whether s/he is 18 or older. For example, among those not missing birth year in Wave 6, those working or married are 18 or older 94% and 98% of the time, respectively. So those who are working, married, with a move date 18 years prior to the interview, or with a relationship of sibling or parent are assumed to be 18 or older. Grandchildren who are not working or married are assumed to be under 18. For the remaining cases still missing, we used the skip pattern for the work question, which was not asked for those under 16 years old. We assumed that those missing whether worked are under 16, and hence, under 18. Please note that in Waves 1 and 2, the earnings questions are not asked for those under 15 years old.

<sup>29</sup>We ran a version using age of the Financial Respondent instead. This did not make a difference in poverty status, but does have some impact on the family category. It is also possible that one of the non-core family residents would be considered "head" by the CPS.

10. Compare family income<sup>30</sup> to poverty threshold for the family to determine:

- (a) Whether below the poverty level (0=No and 1=Yes)
- (b) Ratio of family income to poverty threshold

Both of these measures are provided on the file.

## 4.2. Summary of Data Issues

*Income year versus residence year:* Income measures are from the last calendar year, e.g., 2001, but family composition is from the interview year, e.g., 2002. At this time, we use the family composition as is reported in the household roster at the time of the interview but use last calendar year as the reference year for income, poverty thresholds, and ages of household members.

*Income for unmarried partners:* To be more in line with the CPS definition of the poverty measurement resource unit, we treat partnered Respondents as single, and thus consider only their individual income when creating our various poverty threshold measures. For simplicity, we allocate half the income from other household members to the "family" of each partner.

*Residents who are away and HRS core members living in a nursing home:* The CPS definition does not include family members who are in the military or living in institutions like nursing homes or prisons, but it does include family members who are temporarily away for various reasons, such as as school, jail, rehab, or travel. We do not count core HRS Respondents who live in a nursing home at the time of the interview, and we further adjust total household income by subtracting their individual income. For core Respondents who are in a nursing home, all of the poverty measures are set to a SAS special missing value (.I, for institutionalized).

From Wave 3 forward, information regarding nursing home residence is much more reliable. Users are therefore encouraged to consider this when determining their research objectives.

## 4.3. Variables Included on the RAND HRS Longitudinal File

The variables in the table below are constructed at the household level and merged back to HRS Respondents:

Description	Variables Included on the RAND HRS Longitudinal File
Whether family income is below the poverty threshold	HwINPOV, HwINPOVD
Ratio of family income to poverty threshold	HwINPOVR, HwINPOVRD
Poverty threshold for the family in prior year (i.e., 2001 for Wave 6 and 2003 for Wave 7)	HwPOVTHR
Family composition used to determine poverty threshold	HwPOVFAM
Adjusted family income compared to the poverty threshold <sup>31</sup>	HwPOVHHI, HwPOVHHID

<sup>30</sup>The HRS data collection field period tends to extend into the next calendar year. For example, a few hundred Wave 6 interviews were actually conducted in 2003 and thus reported 2002 income when asked about income received "last calendar year." For these cases we use the CPI to adjust income amounts to the previous calendar year's (2001) dollars, as appropriate, before comparing their income to the same poverty threshold that is used for all other cases interviewed in 2002.

<sup>31</sup>These variables reflect the CPI adjustment as described in the previous footnote.

We also include HwNHMLIV, which summarizes the nursing home residence of the core HRS Respondents<sup>32</sup>:

- 0 = none reside in a nursing home
- 1 = one of a couple resides in a nursing home
- 2 = both in a couple reside in a nursing home
- 3 = the household is a single-Respondent who resides in a nursing home

For cases with codes of 2 or 3, the measures are set to a SAS special missing value (.I, for institutionalized). For cases with a code of 1, the measures are set to .I only for the Respondent who resides in the nursing home.

#### 4.4. Imputing Household Member Income

We impute earnings and non-job income for non-core resident household members who are related to one of the HRS Respondents. We use the same methods as those used to impute the income and wealth measures described elsewhere in this document.

Earnings are imputed if missing for resident household members at least 16 years old and related to one of the HRS Respondents in the household. Imputations are done at the household member level, separately for single and couple HRS households.<sup>33</sup>

If the family member is under 16 or not working, we assume no earnings if missing. For the remainder, ownership is determined by whether the family member is working. If whether working is missing we impute ownership. We then impute complete brackets for cases with missing or incomplete brackets, and finally, we impute earnings.

Total non-job income of resident family members is imputed if missing for all households with any resident family members, including those temporarily away, regardless of whether in an institution or not. One value is reported or imputed for each household with resident family members. Thus these imputations are done at the household level.

Among the continuous values reported, about 60% report a zero for this type of income in Wave 6. We assume no ownership if zeros are reported, and ownership if a positive value is given or if any bracket information indicating a range (complete or incomplete) is provided. If the value is missing and no unfolding bracket questions are answered, we impute ownership. We then impute complete brackets for cases with missing or incomplete brackets that have, or have been imputed to have, this type of income. Based on these complete brackets, a continuous value is imputed.

The covariates used for these imputations include HRS core measures: transformed versions of total household income (HwITOT) and total household assets (HwATOTA), age(s), health, education, race, and work status of HRS core Respondents. Other covariates include the number of resident family members under and over 18 years old and their mean age. In the earnings imputations, additional covariates reflecting the household member's age, sex, marital status, and relationship are also included.

## 5. Social Security and SSI Disability Episodes

The HRS collects information on whether Respondents have applied for and received benefits from various disability programs, including Social Security disability insurance (SSDI), Supplemental Security Income (SSI), Veterans' benefits, and workers' compensation. We have developed a set of variables that represent multiple episodes of application and receipt of SSDI and SSI over the panel.

<sup>32</sup>We use the RAND HRS variables RwnHMLIV and SwNHMLIV to derive HwNHMLIV. In Waves 1 and 2A, there are no Respondents living in a nursing home, so HwNHMLIV = 0 for all Respondents in these waves.

<sup>33</sup>HRS income tends to be lower, and household member income higher, in single compared to couple households. This may indicate that HRS singles with other household residents are parents moving in with their children, whereas HRS couples are taking in adult children.

SSDI is available only if the Respondent has contributed long enough to be eligible. SSI can be awarded on the basis of income without the same contribution requirements as SSDI eligibility. A disabled person may receive benefits from both SSDI and SSI. The typical process begins with an application to the disability program. If denied benefits, one can then appeal the decision or re-apply. Benefits may be awarded either after the original application or re-application or the application may be rejected. Finally, benefits may stop, or in the case of SSDI, transition to SS retirement benefits or SSI old-age benefits when the Respondent reaches the full retirement age.

Each application process is considered an episode in developing these variables from the information provided by HRS. The HRS collects information on the steps outlined above and on when each step is initiated and when the benefits stop. An episode may begin in one wave and be continued over several subsequent waves, for as long as the Respondent receives benefits. Our derived variable, RADNEPI, indicates the number of episodes a Respondent has reported. Additional documentation on these variables is described in more detail in the Social Security section.

Note that we observe the application process only at interviews. It is possible that what we see is incomplete because the interview questions do not capture all of the details. For example, if a person reports receiving benefits at one wave, and still receives them at the next, we assume the benefits arise from the same application, and in some cases, the same program. But it is possible that the benefits being received are from a different one. There are questions about new applications since the last interview, even if a Respondent reports still receiving benefits from a prior wave, but we do not attempt to untangle whether a new application is related to the benefits reported as continuous. We assume it is different and begin another episode.

These variables are developed using information found in the Disability section of the HRS. Some cases have at least one illogical sequence of dates (e.g., date of benefit receipt is before application date). There is additional information in the Assets and Income section regarding SSDI and SSI that could be used to further inform these data, but we do not consider it in this version. Specifically, we have noticed that if a Respondent reports receiving SSDI in the Disability section, s/he sometimes does not report receiving SSDI in the Assets and Income section and vice versa. Therefore, beginning in Wave 9, a new variable (RADISABF) has been derived to document and explain these differences, which can be found in the Social Security section.

## 5.1. Program Type

The HRS questions about SSDI and SSI combine the two programs in interviews before 2000. Beginning in 2000, the questions ask about these programs separately. If a person is receiving benefits at their previous interview, s/he is asked in 2000 which program provides them. If the Respondent reports receiving from only one program, the active episode is assigned a type of either SSDI or SSI as appropriate. If a person reports receiving benefits from both programs, we duplicate the active episode and assign one as SSDI and one as SSI, before updating with information from 2000. Information about any new applications is collected separately and each new application begins a separate episode.

If a person was receiving benefits in 2000, then s/he is again asked which program provides them. If the same program type is reported at both interviews, we update the appropriate episode accordingly. If a person receives benefits from both programs in 2000 and 2002, the two active episodes are updated separately. Sometimes a Respondent appears to change programs from 2000 to 2002, e.g., s/he reports receiving benefits from SSI in 2000 but from SSDI in 2002 without a new application. In this scenario, the benefit reported in 2002 is treated as a continuation of the benefit initially reported in 2000, and the type of program is flagged as ambiguous. If a person reports receiving benefits from both programs in 2000 but only one in 2002, we end the episode for the program that is omitted. If a person reports receiving from only one program in 2000 but from both programs in 2002, we duplicate the active 2000 episode and update both with 2002 information. Similar methods are applied to episodes continued across waves in later waves as well, e.g., in 2004 for episodes continued from 2002.

## 5.2. Episode Status

The normal sequence of steps entails application, and if denied, possibly re-application or appeal, award and receipt of benefits, the end of benefits, application rejected, and benefits not awarded. The most common states of an episode at the end of an interview are receiving, stopped receiving benefits, and not awarded, in that order. A status of applied or appealed/re-applied indicates that a Respondent is last observed with a pending application for the episode. An episode with a status of applied, appealed/re-applied, receiving, or not awarded is considered active, and may be updated with information from subsequent interviews.

A status of not awarded does not necessarily mean the application has been rejected, especially in earlier waves. The specific language of a rejected application is introduced for new applications in 1998. Indeed, some Respondents report that benefits were not awarded in one interview, but then say they are still receiving benefits at the next interview and indicate a receive date between interviews. Prior to 1998, it appears that most Respondents reporting any disability activity at the previous interview are asked if they are still receiving benefits even if they never reported being awarded benefits.

If an initial application for benefits is reported in a wave, then we will track information reported in subsequent waves to determine the outcome of the initial application. Here are some examples of our logic: (1) If a Respondent denies receiving benefits and the status at the previous interview indicates the Respondent had not reported receiving benefits, then we code the initial application as rejected. (2) Similarly, if the Respondent reports s/he is not still receiving benefits and s/he had not previously reported being awarded benefits, we code the application as rejected. In this case, there is a possibility benefits were received for a short time. (3) If a Respondent denies receiving benefits and previously reported that benefits had stopped, the denial confirms the prior wave report. (4) If a Respondent has never reported receiving benefits and reports s/he stopped receiving benefits in one wave and then denies receiving benefits in a subsequent wave, we code the application as rejected—i.e., that benefits were never received.

In some cases an episode is unresolved, i.e., there is an active episode, but the thread is dropped. That is, either no information is given about whether a Respondent is still receiving benefits and a new application is begun, or a Respondent indicates having active episodes for both programs but at the next wave indicates only one. These episodes are given an illogical ending status that indicates what the status was when the thread was dropped.

In some cases it is possible that the appropriate follow-up questions at the next interview are not asked and the episode is thus left somewhat in limbo. These episodes may appear to be still active since no further activity is observed.

## 5.3. Episode Dates

Dates of application, re-application or appeal, and benefit receipt start and stop are collected for each episode. They appear in the raw data as month and year. If the date is missing, we attempt to provide an estimated date. The process of estimating a date entails identifying the upper and lower bounds within which the date may fall. For instance, the upper bound for when the Respondent started receiving benefits would be set based on a stop date if it is known, or the current interview date if a stop date is unknown, and a lower bound would be based on the application or appeal date. Lower and upper bounds for each applicable step are determined. The lower bounds for applications, particularly the first, look at dates of disability, including when the disability began to interfere with work, when a Respondent reports a disabled employment status, and the last month worked. To be used, a date must come before any determined upper bound. If none of these dates is available and before the upper bound, we use a lower bound set to age 18, or, if this does not fit, we use the Respondent's birth date. The estimated date is set to the midpoint between the lower and upper bounds.<sup>34</sup>

Estimated dates are adjusted to ensure that they occur in the expected order, e.g., applications occur before appeals

<sup>34</sup>The RAND HRS Longitudinal File does not include the lower and upper bound dates used to derive the estimated date. Please contact us at [randhrshelp@rand.org](mailto:randhrshelp@rand.org) if you would find these dates useful; we can provide them in a separate file.

---

and receipt of benefits occurs before they stop. If the originally given month and year, or just year is valid, we do not adjust outside the given information. In some cases the dates will seem illogical, because that is the way they were reported.

#### **5.4. Variables**

The disability variables we have developed include the dates of application, re-application or appeal, start of benefits, and when benefits stop. Each application begins a new episode, with its own set of dates and its own status. For each episode date, we provide the month and year as presented in the data, recoded for missing values, and a "best-guess" date which is stored as a SAS date. From the month and year, the analyst can tell how much information was originally provided. The specific variables are listed in Table 7.

The variables begin with "RA" because they are not wave-specific. If they are specific to a particular episode they end with a number, indicating the sequence of the episode. The second to last character of the date variables is "M" for month, "Y" for year, and "D" for SAS date.

We continue to include the disability variables previously provided in the RAND HRS Longitudinal File; these indicate if any of the steps, except stopping benefits, has ever been reported, and if so the earliest date. From Wave 5 forward, a variable with the amount being received has also been added. Amount received is not available before Wave 5.

**Table 7. Disability Episode Variables**

<b>Measure</b>	<b>Description</b>	<b>Variables</b>
<b>Number of episodes</b>	Count, at most 11 as of Wave 15	RADNEPI
<b>Application date</b>	Month	RADAPPM1 to RADAPPM11
	Year	RADAPPY1 to RADAPPY11
	"Best-guess" SAS date	RADAPPD1 to RADAPPD11
<b>Appeal or Reapply date</b>	Month	RADREAM1 to RADREAM11
	Year	RADREAY1 to RADREAY11
	"Best-guess" SAS date	RADREAD1 to RADREAD11
<b>Receive date</b>	Month	RADRECM1 to RADRECM11
	Year	RADRECY1 to RADRECY11
	"Best-guess" SAS date	RADRECD1 to RADRECD11
<b>Stop date</b>	Month	RADENDM1 to RADENDM11
	Year	RADENDY1 to RADENDY11
	"Best-guess" SAS date	RADENDD1 to RADENDD11
<b>Type</b>	1=SSDI	RADTYPE1 to RADTYPE11
	2=SSI	
	3=DK which	
	4=SSDI/SSI at different waves	
<b>Current Status</b>	Indicates if applied, receiving, stopped receiving, or illogical ends	RADSTAT1 to RADSTAT11

## 6. Structure of Codebook

The Appendix contains the codebook documenting all variables in the RAND HRS Longitudinal File. This section explains how to interpret the codebook entries. The figure below shows a typical codebook page; the numbers in circles correspond to comments below.

<b>Current Marital Status: Current Partnership Status</b>				<b>1</b>
Wave	Variable Name	Variable Label		Type
<b>2</b> →	1 R1MPART	R1MPART:W1 R partnered		Categ

.Z=No Exit Interview, Death	1394
0. No	16109
1. Yes	402

## 7 How Constructed

### Core Interview Variables

Marital status RwmSTAT indicates partnership; that is, living with a partner who is not the Respondent's spouse. In addition, some cases report an unmarried status, but have a partner in the same household. Another living individual with the same HHID and sub-household ID on the Tracker file, or in the core data, indicates the presence of a partner when the Respondent gives an unmarried status. From Wave 4 forward, the "coupleness" code in the cover sheet section can also indicate a partnership. RwmPART indicates the presence of a partner regardless of the RwmSTAT code.

The spouse variable SwMPART is taken from the spouse's data for Wave 'w.' In some cases, the spouse and Respondent disagree as to whether they are married or partnered, so RwmPART and SwMPART are not always the same in a given wave. SwMPART is set to .U if the Respondent is unmarried and unpartnered or .V if the Respondent's spouse or partner did not respond in a given wave.

### Exit Interview Variables

REMPART is a yes/no marital status indicator of whether the Respondent was partnered at the time of death. We define partnered as living with a partner who is not the Respondent's spouse. From Wave 4 forward, a separate cover sheet code indicates partnership.

### Core and Exit Differences

Partnership is indicated by a marital status code in Waves 2H and 3 of the Exit Interviews. From Exit Interview Wave 4 forward, REMPART utilizes separate cover sheet data to code partnership.

In the RAND HRS Longitudinal File, partnership can be indicated by another living individual with the same HHID and sub-household ID on the Tracker file or if the core data indicates the presence of a partner when Respondent gives an unmarried status.

## 8 Cross Wave Differences in Original HRS Data

### Core Interview Variables

Partnership is indicated by a marital status code in Waves 1 to 3H. From Wave 4 forward, it is indicated by a separate cover sheet section variable.

Partnership can also be indicated by a non-married status when the household is a couple, rather than single in any wave.

### Exit Interview Variables

In Waves 2H and 3, partnership is indicated by a marital status code in the Exit Interviews. From Wave 4 forward, REMPART utilizes separate cover sheet data.

## 9 HRS Variables Used

### Core Interview Variables

HRS 1992:	
V10225	A10:CURRENT MAR STAT:IND
V225	A10:CURRENT MARR STA:IMP
AHEAD 1993:	
B150	A11. R'S MARITAL STATUS
HRS 1994:	
W200	A1. Marital Status
AHEAD 1995:	
DMSTATR	HRS 95: Marital Status (w/ partnered)
HRS 1996:	
E256A	MARRIAGE STATUS - CORRECTED
HRS 1998:	
F1071	A43A.MARITAL STATUS, ASSIGNED
F546	CS15D.CURRENT COUPLENESS
FMARSTP	HRS 98: Marital Status (w/ partnered)
HRS 2000:	
G1158	A43A.MARITAL STATUS_ASSIGNED
G597	CS15D.CURRENT COUPLENESS
GMARSTP	HRS 00: Marital Status (w/ partnered)
HRS 2002:	
HMARITAL	MARITAL STATUS
HRS 2002-2020:	
xPN_SP	2002 SPOUSE/PARTNER PERSON NUMBER
xSUBHH	2002 SUB-HOUSEHOLD IDENTIFIER
xX065_R	COUPLENESS STATUS - UPDATED

## Exit Interview Variables

AHEAD 1995:

N204	PRELOAD MAR STAT
N245	CS8x.W1 COUPLE PARTNER
N248	CS10x.W1 ONLY NEW PARTNER
N250	CS12.COUPLE LIVE TOGETHER
N674	A21.R MARITAL STATUS

HRS 1996:

P204	PRELOAD MAR STAT
P245	CS8x.W1 COUPLE PARTNER
P248	CS10x.W1 ONLY NEW PARTNER
P250	CS12.COUPLE LIVE TOGETHER
P692	A21.R MARITAL

HRS 1998:

Q1071	A43a.MARITAL STATUS, ASSIGNED
Q506	CS5x.PRELOAD SPOUSE/P ALIVE
Q509	CS7x.1ST R MARRIED
Q510	CS8x.COUPLE PARTNER
Q523	CS12.COUPLE LIVE TOGETHER
Q530	CS15A.MARRIED OR SEPARATED
Q531	CS15B.SEPARATED:PARTNERED?
Q548	CS15D.CURRENT COUPLENESS

HRS 2000:

R1134	A43a.MARITAL STATUS ASSIGNED
R483	CS0Y9a.PRELOAD MARITAL STATUS
R545	CS5x.PRELOAD SPOUSE/P ALIVE
R548	CS7x.1ST R MARRIED
R549	CS8x.COUPLE PARTNER
R562	CS12.COUPLE LIVE TOGETHER
R569	CS15A.MARRIED OR SEPARATED
R570	CS15B.SEPARATED:PARTNERED?
R597	CS15D.CURRENT COUPLENESS

HRS 2002:

SA020	1ST R SAME SP/P
SA023	PREVIOUS WAVE SP/P ALIVE
SA026	R MARRIED
SA034	MARRIED OR SEPARATED
SA038	CURRENT COUPLENESS

HRS 2002-2020:

xA030	COUPLE LIVE TOGETHER
xB061	MARITAL STATUS IF UNMARRIED
xx065_R	COUPLENESS STATUS R - UPDATED

HRS 2004-2020:

xA027	LIVING W/P
xB063	MARITAL STATUS ASSIGNED

## Tracker Variables

Tracker:

HHID	HOUSEHOLD IDENTIFIER
xALIVE	1994-2020 VITAL STATUS
xPPN	1992-2020 SPOUSE-PARTNER PERSON NUMBER
xSUBHH	1992-2020 SUB-HOUSEHOLD IDENTIFIER

**1** *Title:* The variables are documented in groups according to the concept that they measure. For example, there are three sets of variables related to current partnership status: Respondent-level core data; Spouse-level core data; and

Respondent-level exit data. The title is often followed by a short description of the concept that is captured.

- 2 *Variable Names*: This entry shows the names of variables in the group. Not all variables are present in all waves.
- 3 *Variable Labels*: This entry shows the SAS/Stata variable labels. As discussed above, the labels typically include the name of the variable, the wave in which it is present, and a description of its contents.
- 4 *Variable Type*: This entry indicates the type of variable. It may be continuous (Cont), categorical (Categ), or character (Char).
- 5 *Descriptive Statistics*: This entry shows descriptive statistics on each variable. They include the number of nonmissing values, the mean, standard deviation, minimum value, and maximum value.
- 6 *Categorical Variable Codes*: This entry shows the value label codes for categorical variables. The first character(s) of the value labels indicate the value to which each label has been assigned. For example, value "1" is mapped into "1.Yes" (not just "Yes"). The entry also indicates which labels are assigned to which variables, and shows frequency tabulations for all categorical variables.
- 7 *How Constructed*: This entry provides background on the manner in which variables were constructed. This is broken into subsections for Core Interview Variables and Exit Interview Variables. If there are differences between Core and Exit variables, there is an additional subsection that highlights these differences.
- 8 *Cross Wave Differences in Original HRS Data*: This entry briefly describes differences in question wording or contents between interview waves. This is broken into subsections for Core Interview Variables and Exit Interview Variables.
- 9 *HRS Variables Used*: This entry provides the names and labels of raw HRS variables that were used to construct the new variables. This is broken into subsections for Core Interview Variables and Exit Interview Variables. We have streamlined the manner in which the raw HRS variables appear in this section. Specifically, in cases where the variable suffix is the same across waves, we list that variable only once, and preface it with an "x". The table below shows the variable prefixes for each year.

Wave	Year	Core Data Prefix(x)	Exit Data Prefix(x)
1	1992	V	-
2	1993	V (B in RAND HRS Fat File)	-
2	1994	W	W
3	1995	D	N
3	1996	E	P
4	1998	F	Q
5	2000	G	R
6	2002	H	S
7	2004	J	T
8	2006	K	U
9	2008	L	V
10	2010	M	W
11	2012	N	X
12	2014	O	Y
13	2016	P	Z
14	2018	Q	XQ
15	2020	R	XR

## 7. Distribution and Technical Notes

The RAND HRS Longitudinal File is distributed with the following:

- Documentation: an electronic version of this documentation.
- SAS files: all waves of data in SAS format, compatible with Version 8 or later.
- Stata files: all waves of data in Stata format, compatible with Version 11 SE or later.
- SPSS files: all waves of data in SPSS for Windows format, compatible with Version 18 or later.

This is Version 2 of the RAND HRS Longitudinal File 2020.

We suggest that you create a directory for these files and subdirectories for the pieces, for example:

C:\randhrs\doc                   for this file  
 C:\randhrs\sasdata           for the SAS files  
 C:\randhrs\stata             for the Stata files  
 C:\randhrs\spss              for the SPSS files

### 7.1. Distribution files for Web Download

The files can be downloaded from the HRS web site (<https://hrsdata.isr.umich.edu/data-products/rand>), once you have registered to use HRS data. They are zipped for downloading; you must unzip them to make them usable. They are available for download as an entire package or documentation only. There are three different format packages: SAS, Stata 11 SE and SPSS 18 for Windows.

SAS and Stata formats differ in value labels and missing value codes. The SAS format is the most comprehensive. Stata allows value labels for integer values only, so no value labels are available for non-integer values. Beginning with Version 8, Stata supports multiple codes for missing values (.X, .S, .M, etc.). SPSS does not support multiple missing codes.

#### RAND HRS Data Distribution Files

Distribution file name	Included Files	Description
randhrs1992_2020v2_SAS.zip	randhrs1992_2020v2.pdf	Codebook
	randhrs1992_2020v2.sas7bdat	Dataset (SAS): All waves merged
	sasfmts.sas7bdat	Formats (SAS)
randhrs1992_2020v2_STATA.zip	randhrs1992_2020v2.pdf	Codebook
	randhrs1992_2020v2.dta	Dataset (Stata 11 SE): All waves merged
randhrs1992_2020v2_SPSS.zip	randhrs1992_2020v2.pdf	Codebook
	randhrs1992_2020v2.sav	Dataset (SPSS 18): All waves merged

### 7.2. The SAS Format Library

Many of the derived variables on this file have been assigned SAS formats, or value labels. There are also SAS formats that are used to look up values using the SAS PUT function in data steps. For instance, the format library includes yearly CPI-U values in this form.

We are no longer distributing SAS formats as a format catalog. Instead we are providing SAS code to allow the

researcher to create their own formats catalog on any computing platform.

To create a formats catalog, assuming `sasfmts.sas7bdat` is in `C:\randhrs\sasdata`, simply run the following code:

```
libname library "C:\randhrs\sasdata";
proc format library=library cntlin=library.sasfmts;
run;
```

This SAS code will create a file called `C:\randhrs\sasdata\formats.sas7bcat`

The formats can be found in text format in one of the `Fmt\*.fmt` files and are all included in a SAS dataset (`sasfmts.sas7bdat`).

### 7.2.1. Using (or Not Using) the SAS formats

To use them from the SAS format library you must include a `LIBNAME LIBRARY` statement:

```
LIBNAME LIBRARY "&fmtlib";
```

Where `"&fmtlib"` is the name of the directory where the `formats.sas7bcat` file is stored. You can either put this statement in your SAS programs, e.g.:

```
LIBNAME LIBRARY "c:\randhrs\sasdata";
```

where the format file is `C:\randhrs\sasdata\formats.sas7bcat`, or use `"%include setuphrs.inc"` where you have set the macro variable `&fmtlib` to the name of the appropriate directory.

If you do not have the `LIBNAME LIBRARY` statement in your program, SAS usually gives you an error message and stops processing, unless you specify `NOFMterr` on an `OPTIONS` statement.

If you prefer not to use the assigned SAS formats, you can use the following statement in SAS PROC steps or just after a `SET` or `MERGE` in a data step to unassign all formats:

```
FORMAT _ALL_ ;
```

You can then assign formats as you wish. The format assignments we assigned to variables can be found by running a `PROC CONTENTS` on the data files. They are also listed in `*.format` files located in subdirectories of the `Pgm\` directory. For example, the `SS\ss_p.format` file contains the SAS `FORMAT` statement that assigns Social Security variables to their formats.

### 7.2.2. Consumer Price Index (CPI-U)

These deflation factors are based on the Bureau of Labor Statistics' series of Consumer Price Index for All Urban Consumers (CPI-U), All Items. In this series, 1982-84 is normalized to 100. For details see <http://www.bls.gov/cpi>. The index is stored in a SAS format called `CPI`. To get the CPI-U for a year you can use the following in a SAS data step:

```
cpiu=put (ayear, CPI.);
```

Where `"ayear"` is the name of a variable containing the 4-digit year for which you want the CPI-U and `"cpiu"` is the name of the variable that will hold the index for that year. `"CPI."` is the name of the SAS format that has the indices for all available years. The `CPI` format is stored on the `sasfmts.sas7bdat` file provided with this dataset.

### 7.3. Using the Data with Other HRS Files

To use these data with other HRS files, including the RAND HRS Fat Files, you should be able to simply merge by HHIDPN. All RAND files are already sorted by this ID so should not need to be resorted. For instance to merge additional data from all waves of the RAND HRS Fat Files with RAND HRS Longitudinal File, you could use the following:

```
%include "[dir]\setuphrs.inc";
  libname mylib "[name of folder to store your files]";
data mylib.newfile;
  merge randhrs.randhrs1992_2020v2 (keep=HHIDPN [list of other variables])
    hrs.hd92f1b (keep=HHIDPN [list of raw core variables])
    hrs.ad93f2a (keep=HHIDPN [list of raw core variables])
    hrs.h94f1a (keep=HHIDPN [list of raw core variables])
    hrs.ad95f2b (keep=HHIDPN [list of raw core variables])
    hrs.h96f4a (keep=HHIDPN [list of raw core variables])
    hrs.hd98f2c (keep=HHIDPN [list of raw core variables])
    hrs.h00f1d (keep=HHIDPN [list of raw core variables])
    hrs.h02f2c (keep=HHIDPN [list of raw core variables])
    hrs.h04f1c (keep=HHIDPN [list of raw core variables])
    hrs.h06f4a (keep=HHIDPN [list of raw core variables])
    hrs.h08f3a (keep=HHIDPN [list of raw core variables])
    hrs.hd10f6a (keep=HHIDPN [list of raw core variables])
    hrs.h12f3a (keep=HHIDPN [list of raw core variables])
    hrs.h14f2b (keep=HHIDPN [list of raw core variables])
    hrs.h16f2c (keep=HHIDPN [list of raw core variables])
    hrs.h18f2b (keep=HHIDPN [list of raw core variables])
    hrs.h20f1a (keep=HHIDPN [list of raw core variables]);

  by HHIDPN;
```

where "[list of (other/raw core) variables]" would be replaced by a list of the SAS variables you want to include. You can omit the KEEP option to include all the variables from a given dataset, but in this example the output file would be extremely large if you did so for all the files listed.

If you have HRS data files which use the character version of HHIDPN, the RAHHIDPN variable provides the 9-character equivalent of HHIDPN, filled with leading zeros, the format that corresponds to the concatenated HHID and PN character IDs provided in the raw HRS data. You may wish to rename HHIDPN to NHHIDPN and RAHHIDPN to HHIDPN or whatever variable name you have used on your other HRS data files. HHID and PN are also included as separate variables in the above files, and can be used to perform the merge as well.

Please visit our website at [https:// www.rand.org/well-being/social-and-behavioral-policy/centers/aging/dataprod/helphrs.html](https://www.rand.org/well-being/social-and-behavioral-policy/centers/aging/dataprod/helphrs.html) for sample programs with SAS, Stata, and SPSS examples.

## **8. Data Codebook**

## Contents of Data Codebook

<b>Section A: Demographics, Identifiers, and Weights</b>	<b>60</b>
Person Specific Identifier . . . . .	61
Household Identifier . . . . .	63
Spouse Identifier . . . . .	66
Overlap Identifier for cases that moved from HRS to AHEAD . . . . .	68
Wave Status: Response Indicator . . . . .	72
Wave Status: Interview Status . . . . .	74
Exit or Post-Exit Interview Administered . . . . .	77
Sample Cohort . . . . .	80
Whether Eligible for the HRS Sample . . . . .	83
Sampling Weight . . . . .	86
Household Analysis Weight . . . . .	87
Person-Level Analysis Weight . . . . .	89
Number of Household Respondents . . . . .	94
Whether Couple Household . . . . .	95
Financial, Family Respondent . . . . .	97
Whether Proxy Interview . . . . .	104
Interview Dates . . . . .	108
Birth date: Month, Year, and SAS date . . . . .	120
Death date: Month, Year, and SAS date . . . . .	125
Age at interview, death (in months and years) . . . . .	132
Gender . . . . .	142
Race, Ethnicity: Race . . . . .	144
Race, Ethnicity: Whether Hispanic . . . . .	147
Census Region . . . . .	150
Urbanicity . . . . .	158
Education: Years of Education . . . . .	162
Education: Degrees, Diplomas . . . . .	165
Education: Categorical summary . . . . .	169
Parents' Education . . . . .	171
Current Marital Status: With partnership . . . . .	177
Current Marital Status: Current Partnership Status . . . . .	185
Current Marital Status: Without partnership . . . . .	190
Marital History . . . . .	200
Length of current and longest marriage . . . . .	215
Religion . . . . .	224
Veteran status . . . . .	227
Place of birth . . . . .	230
Parental mortality . . . . .	235
<b>Section B: Health</b>	<b>245</b>
Self-report of health . . . . .	246
Self-report of health change . . . . .	250
Medical care utilization: Hospital . . . . .	256
Medical care utilization: Nursing Home . . . . .	264
Medical care utilization: Hospice . . . . .	279
Medical care utilization: Doctor . . . . .	282
Medical care utilization: Home Care . . . . .	288

Medical care utilization: Other Medical Care Utilization . . . . .	293
Medical expenditures: Out of Pocket and Total . . . . .	304
Mental health (CESD score) . . . . .	328
Doctor diagnosed health problems: Raw Recodes and Question Wording . . . . .	353

Imputed Cognition: Vocabulary . . . . .	666
Imputed Cognition: Summary Scores . . . . .	675
Proxy Rating of Respondent Memory . . . . .	681
Cognitive Impairment . . . . .	687
Physical Measures: Blood Pressure . . . . .	699
Physical Measures: Breathing Test . . . . .	705
Physical Measures: Grip Strength . . . . .	709
Physical Measures: Balance Tests . . . . .	716
Physical Measures: Timed Walk . . . . .	726
Physical Measures: BMI, Height, Weight, Waist . . . . .	730
<b>Section C: Functional Limitations and Helpers</b> . . . . .	<b>740</b>
Whether health limits work . . . . .	741
Bedridden Around Time of Death . . . . .	745
Activities of daily living (ADLs): Skip Flag . . . . .	747
Activities of daily living (ADLs): Raw recodes . . . . .	750
Activities of daily living (ADLs): Time Helped Before Death . . . . .	797
Activities of daily living (ADLs): Any difficulty . . . . .	801
Activities of daily living (ADLs): Recodes for comparison to Wallace and Herzog . . . . .	818
Instrumental activities of daily living (IADLs): Raw recodes . . . . .	823
Instrumental Activities of daily living (IADLs): Time Helped Before Death . . . . .	863
Instrumental activities of daily living (IADLs): Any difficulty . . . . .	866

IADLs: Recodes for comparison to Wallace and Herzog . . . . .	884
Other Functional Limitations: Raw recodes . . . . .	888
Other Functional Limitations: Any difficulty . . . . .	929
Other Functional Limitations: Recodes for comparison to Wallace and Herzog . . . . .	957
ADL Summary: Sum of ADLs where Respondent reports any difficulty, gets help . . . . .	966
IADL Summary: Sum of IADLs where Respondent reports any difficulty, gets help . . . . .	972
Other Summary Indices: Mobility, Large Muscle, Gross Fine Motor Activities . . . . .	976
Safety Supervision Prior to Death . . . . .	982
ADLs, IADLs, and Finances: Total Number of Helpers . . . . .	983
ADLs, IADLs, and Finances: Number of Paid and Unpaid Helpers . . . . .	990
ADLs, IADLs, and Finances: Number of Family and Non-Family Helpers . . . . .	997
ADLs, IADLs, and Finances: Total Amount of Help Received . . . . .	1004
ADLs, IADLs, and Finances: Amount of Paid and Unpaid Help Received . . . . .	1008
ADLs, IADLs, and Finances: Amount of Family and Non-Family Help Received . . . . .	1014
ADLs, IADLs, and Finances: Total Payments to Helpers . . . . .	1020
ADLs, IADLs, and Finances: Payments to Family and Non-Family Helpers . . . . .	1024

#### **Section D: Financial and Housing Wealth 1130**

Net value of real estate (not primary residence) . . . . .	1031
Net value of vehicles . . . . .	1036
Net value of businesses . . . . .	1041
Net value of IRA, Keogh accounts . . . . .	1046
Net value of stocks, mutual funds, and investment trusts . . . . .	1052
Value of checking, savings, or money market accounts . . . . .	1057
Value of CD, government savings bonds, and T-bills . . . . .	1062
Net value of bonds and bond funds . . . . .	1067
Net value of all other savings . . . . .	1072
Value of other debt . . . . .	1077
Value of primary residence . . . . .	1081
Value of all mortgages/land contracts (primary residence) . . . . .	1087
Value of other home loans (primary residence) . . . . .	1093
Net value of primary residence . . . . .	1098
Value of secondary residence . . . . .	1100
Value of all mortgages/land contracts (secondary residence) . . . . .	1106
Net value of secondary residence . . . . .	1112
Net value of non-housing financial wealth . . . . .	1115
Total Wealth . . . . .	1117
Total Wealth (Excluding IRAs) . . . . .	1119
Total Non-housing Wealth . . . . .	1121

#### **Section E: Income 1123**

Individual Earnings . . . . .	1124
Household Capital Income . . . . .	1134
Individual Income from Employer Pension or Annuity . . . . .	1148
Individual Income from Social Security DI or SSI . . . . .	1169
Individual Income from Social Security Retirement . . . . .	1186
Individual Unemployment or Workers Compensation . . . . .	1194
Individual income from other government transfers . . . . .	1206
All other household income . . . . .	1218
Total household income (Respondent & spouse) . . . . .	1226

IRA Withdrawals . . . . .	1229
Poverty Threshold . . . . .	1242
<b>Section F: Social Security</b>	<b>1259</b>
Receives Social Security in any wave . . . . .	1260
Age when started to receive Social Security . . . . .	1262
Change in Social Security Disability Income (SSDI) or Supplemental Security Income (SSI) Status . . . . .	1265
SSDI, SSI Disability Episodes . . . . .	1308
SSDI, SSI Status (Each Wave) . . . . .	1332
Respondent is Receiving SSDI (Each Wave) . . . . .	1338
SSDI, SSI Amount Receiving (Each Wave) . . . . .	1341
Predicted SS wealth of Pre-retirees . . . . .	1344
<b>Section G: Pension</b>	<b>1355</b>
Currently receiving any pension income . . . . .	1356
Number of pensions currently receive . . . . .	1360
Whether pensions can continue . . . . .	1365
Any pension from current job . . . . .	1372
Number of pension plans from current job . . . . .	1381
Type of pension plan from current job . . . . .	1388
Detailed type of pension plan from current job . . . . .	1400
Respondent's annual contribution to DC plan on current job . . . . .	1418
Respondent's account balance for DC plan from current job . . . . .	1432
Employer's annual contribution to Respondent's DC plan . . . . .	1441
<b>Section H: Health Insurance</b>	<b>1467</b>
Covered by federal government health insurance program . . . . .	1468
Medicare/Medicaid HMO monthly premium . . . . .	1484
Medicare Part D prescription drug insurance monthly premium . . . . .	1488
Number of private health insurance plans . . . . .	1490
private health insurance premium amounts . . . . .	1496
source of private health insurance plans . . . . .	1507
Covered by health insurance from a current or previous employer . . . . .	1523
Whether employer-provided health plan covers retirees . . . . .	1538
Number of employer-provided/private health insurance plans . . . . .	1543
Plan-specific employer-provided health insurance: Source of insurance and who is covered . . . . .	1546
Plan-specific employer-provided health insurance: Coverage in retirement . . . . .	1569
Covered by other health insurance . . . . .	1589
Covered by long-term care insurance . . . . .	1595
Covered by life insurance . . . . .	1606
<b>Section I: Family Structure</b>	<b>1613</b>
Number of people living in the household . . . . .	1614
Number of children . . . . .	1617
Number of living siblings . . . . .	1620
Number of children ever born . . . . .	1626

<b>Section J: Retirement Plans, Expectations</b>	<b>1629</b>
Whether retired: Consider self retired . . . . .	1630
Whether retired: Retirement Month and Year, If Says Retired . . . . .	1634
Planned retirement year . . . . .	1640
Expects spouse to retire at the same time . . . . .	1645
Concerned about having enough retirement income . . . . .	1647
Expectations regarding retirement living standards versus current living standards . . . . .	1649
Expectation of total retirement wealth . . . . .	1651
Plans to continue paid work in retirement . . . . .	1652
Self-reported probability of living to age 75 . . . . .	1654
Self-reported probability of living to age 85 . . . . .	1659
Change in Health: Self-reported Mortality Expectations . . . . .	1666
Categorical risk aversion: based on the set of "income gamble" questions . . . . .	1676
Financial planning horizon . . . . .	1682
Did Respondent respond to at least the first three probability questions . . . . .	1686
Self-reported probability of receiving an inheritance . . . . .	1689
Self-reported probability of leaving a bequest . . . . .	1691
Self-reported probability of working full-time after age 62 . . . . .	1698
Self-reported probability of working full-time after age 65 . . . . .	1703

**How Constructed**

HHID is the 6-character HRS household identifier, and PN is the 3-character person number. Together, HHID and PN uniquely identify each individual in the HRS public-release data. On the RAND HRS Longitudinal File, they are provided separately and, for convenience, in combination as HHIDPN and RAHHIDPN.

HHIDPN is the numeric version of the combined household and person identifier that identifies each Respondent uniquely. It is set to  $HHID * 1000 + PN$ . RAHHIDPN is the 9-character version of HHIDPN, with leading zeros. For example, if the HHID is 012345 and PN is 010 then HHIDPN is 12345010 and RAHHIDPN is 012345010.

HHID and PN, HHIDPN, and RAHHIDPN are all equivalent and unique identifiers, and the RAND HRS Longitudinal File sort order is the same for all three. To merge the RAND HRS Longitudinal File with other data sources, one may use the single variables HHIDPN or RAHHIDPN, or the two variables HHID and PN, whichever is available and most convenient. Other RAND data products also provide all of these identifiers. The programs used to develop the RAND HRS Longitudinal File use HHIDPN, so that means of the numeric ID may be checked to ensure none are missing.

Around 100 individuals responded to HRS 1992 (W1) but were AHEAD eligible, and their households were given to the AHEAD sample. From 1993 on they are treated as AHEAD cases. On this file these cases are identified by their AHEAD IDs, and are linked to their HRS 1992 data. These are the only AHEAD entry cohort Respondents with any W1 data. These "HRS-AHEAD" overlap cases are identified by RAOVRLAP (=1).

One case is married to an HRS-AHEAD overlap case in Wave 1 but not identified as an overlap on the Tracker file. We flag them as an HRS-AHEAD overlap case (RAOVRLAP = 1) with RAOHRSID = 20582020 and HHIDPN = 204940020. The only wave to which this case responds is Wave 1.

In addition a few individuals within the AHEAD sample married someone from a different AHEAD household. These cases have one AHEAD ID for early waves, but are assigned a new one after the within-sample marriage in the core public use data. This file identifies these Respondents by their most recent AHEAD ID and links their data across all waves. RAOVRLAP gives the last year in which the original HHIDPN is assigned, i.e., the last interview before the within-sample marriage. For example, if someone married another AHEAD sample member in different household between 1995 and 1998, RAOVRLAP=1995. These "AHEAD-AHEAD" overlap cases are identified by RAOVRLAP as well (=2).

Also in 2004, two households were identified and selected to be in the HRS survey. Both these households were 2-person households containing a married couple. However, there is a lag between when a household is identified and when they actually start to answer survey questions. So, it was 2010 before they actually responded to any HRS survey questions. By 2010, these households had split and

so, in the 2010 Core data we had the following IDs HHIDPN=526934010 split from HHIDPN=525520010 and HHIDPN=529766010 split from HHIDPN=520845010.

By 2012, these couples had reunited and so in the 2012 Tracker file, their IDs change from HHIDPN=526934010 to HHIDPN=525520020  
HHIDPN=529766010 to HHIDPN=520845020

In the RAND HRS data products, these cases are referenced by their 2012 ID's. The IDs they had in the 2010 Core data can be found in RAOHRSID. Also, they can be identified by RAOVRLAP=3.

In 2018, two Respondents married another HRS Respondent. HHIDPN=906126010, who entered the survey in 2010, married HHIDPN=906543010. We changed HHIDPN=906126010 to be HHIDPN=906543020 and set RAOHRSID=906126010, RAOVRLAP=3 and RAOVRAYR=2010. HHIDPN=544849010, who entered the survey in 2016, married HHIDPN=540162010. We changed HHIDPN= 544849010 to be HHIDPN=540162020 and set RAOHRSID=544849010, RAOVRLAP=3 and RAOVRAYR=2016.

For both cases we set the sub-household ID to 1 until they marry in 2018, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2018. For example, for HHIDPN=540162020, H13HHID=5401621 and H14HHID= 5401620.

In 2020, one Respondent married another HRS Respondent. HHIDPN=541986010, who entered the survey in 2016, married HHIDPN=541110010. We changed HHIDPN=541986010 to be HHIDPN=541110020 and set RAOHRSID=541986010, RAOVRLAP=3 and RAOVRAYR=2016. We set the sub-household ID for HHIDPN=541110020 to 1 until they marry in 2020, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2020. For example, for HHIDPN=541110020, H13HHID=5411101, H14HHID=5411101, and H15HHID= 5411100.

Based on data alerts from HRS, we have made several changes to cases in 2000 and 2002. There is one case deleted in each of these years, and in 2000, HHIDPN 75573041 is changed to 75573010.

Please refer to "Section A: Demographics" in Appendix A for a list of overlap cases and other ID change information. Please see the section on "Overlap cases" for a description of the RAOVRLAP flag and alternate IDs.

## How Constructed

The HwHHID identifiers combine HHID with a sub-household ID for each wave. They uniquely identify a household in a given wave. Households that split are given different subHH IDs by HRS. HwHHID is numeric (HHID\*10+subHH). HwHHIDC is the 7-character version, with leading zeros. For example, if HHID is 012345 and the Wave "w" subHH is 2 then HwHHID is 123452 and HwHHIDC is "0123452."

Around 100 individuals responded to HRS 1992 (W1) but were AHEAD eligible, and their households were given to the AHEAD sample. From 1993 on they are treated as AHEAD cases. On this file these cases are identified by their AHEAD IDs, and are linked to their HRS 1992 data. These are the only AHEAD entry cohort Respondents with any W1 data. These "HRS-AHEAD" overlap cases are identified by RAOVRLAP (=1).

In addition a few individuals within the AHEAD sample married someone from a different AHEAD household. These cases have one AHEAD ID for early waves, but are assigned a new one after the within-sample marriage. This file identifies these Respondents by their most recent AHEAD HHIDPN. RAOVRAYR gives the last year in which the original HHIDPN is assigned, i.e., the last interview before the within-sample marriage. For example, if someone married another AHEAD sample member in different household between 1995 and 1998, RAOVRAYR=1995. These are "AHEAD-AHEAD" overlap cases and are identified by RAOVRLAP as well (=2).

Also in 2004, two households were identified and selected to be in the HRS survey. Both these households were 2-person households containing a married couple. However, there is a lag between when a household is identified and when they actually start to answer survey questions. So, it was 2010 before they actually responded to any HRS survey questions. By 2010, these households had split and so, in the 2010 Core data we had the following IDs HHIDPN=526934010 split from HHIDPN=525520010 and HHIDPN=529766010 split from HHIDPN=520845010.

By 2012, these couples had reunited and so in the 2012 Tracker file, their IDs change from  
HHIDPN=526934010 to HHIDPN=525520020  
HHIDPN=529766010 to HHIDPN=520845020

In the RAND HRS data products, these cases are referenced by their 2012 IDs. The IDs they had in the 2010 Core data can be found in RAOHRSID. Also, they can be identified by RAOVRLAP=3.

In 2018, two Respondents married another HRS Respondent. HHIDPN=906126010, who entered the survey in 2010, married HHIDPN=906543010. We changed HHIDPN=906126010 to be HHIDPN=906543020 and set RAOHRSID=906126010, RAOVRLAP=3 and RAOVRAYR=2010. HHIDPN=544849010, who entered the survey in 2016, married HHIDPN=540162010. We changed HHIDPN= 544849010 to be HHIDPN=540162020 and set RAOHRSID=544849010, RAOVRLAP=3 and RAOVRAYR=2016.

For both cases we set the sub-household ID to 1 until they marry in 2018, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2018. For example, for HHIDPN=540162020, H13HHID=5401621 and H14HHID= 5401620.

In 2020, one Respondent married another HRS Respondent. HHIDPN=541986010, who entered the survey in 2016, married HHIDPN=541110010. We changed HHIDPN=541986010 to be HHIDPN=541110020 and set RAOHRSID=541986010, RAOVRLAP=3 and RAOVRAYR=2016. We set the sub-household ID for HHIDPN=541110020 to 1 until they marry in 2020, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2020. For example, for HHIDPN=541110020, H13HHID=5411101, H14HHID=5411101, and H15HHID= 5411100.

For the HRS-AHEAD overlap cases the HwHHID and HwHHIDC variables reflect the AHEAD household identifier in all waves. For the AHEAD-AHEAD overlap cases, HwHHID and HwHHIDC reflect the actual AHEAD sub-household for the Respondent in each wave. So, for example, if the Respondent was in household 2000000 in 1995 and married into household 2900000 in 1998, H3HHID would be 2000000 and H4HHID would be 2900000.

Please refer to "Section A: Demographics" in Appendix A for a list of overlap cases.

Also in Wave 3H, there are a few households that appear to be reunited based on answers to questions in the cover sheet section. They are reunited in Wave 4 in the public use HRS core data, but have different sub-household IDs in Wave 3. We reunite them in Wave 3 in the RAND HRS Longitudinal File. These households are: 17520 (PNs 010 and 040), 22999 (PNs 010 and 020), 40609 (PNs 010 and 020), 40441 (PNs 010 and 020), 50945 (PNs 010 and 040). These cases will have different sub-household IDs in H3HHID from the ESUBHH found in the Tracker and core 1996 files. The spouse PNs will also differ.

In 1994, one household, 15730 is split in the core data, but is together in the Tracker file. In this household, 15730020 was interviewed, but then died before the widow (15730030) was interviewed. We treat these two cases as being in separate households, as they are in the core data.

In some other households, the Tracker file shows a non-responding spouse, but the core data indicate that the couple is split. We treat these couples as split. In most households, this involves a change for the non-responding spouse so that the sub-household ID on this file differs from that on the Tracker file, but still matches that on the core data. For two households, 10646 and 65564, the FSUBHH used to derive H4HHID also differs from that on the core 1998 data for the responding spouse. That is, they are shown as not split in both Tracker and 1998 core data, but are split on the RAND HRS Longitudinal File based on core cover sheet information. Note that the spouse PN for the responding spouse in these two households was set to missing in Wave 4.

## How Constructed

### Core Interview Variables

HRS Respondents have up to 4 different individuals as spouses or partners from 1992 to 2020. Cohabiting partners are treated as spouses for all but the marriage variables in this file. RASPCT tells how many spouses the Respondent has over all waves. Their HHIDPNs are given in RASPID1-RASPID4. SwHHIDPN gives the HHIDPN of the spouse in Wave "w." The SwHHIDPN variables are derived from HHID and the spouse person numbers found in the core data and on the Tracker file. These are the numeric versions of the IDs.

There are a number of cases where the spouse PN on the Tracker file does not match that used in the core data or in this file. In some cases the spouse identified on the Tracker is deceased or otherwise non-responding when the Respondent indicates not being married or partnered. In other cases, the spouse PN is missing on the Tracker file, but is available in the core data. On this file, the SwHHIDPNs of deceased or other spouses no longer part of the couple are set to zero, and core spouse PNs are used when missing from Tracker.

If there is no spouse in a given wave, SwHHIDPN is set to zero. If SwHHIDPN is unknown, and the marital status in a particular wave is either missing (.M) or married, SwHHIDPN is set to a special missing code of .M. If the Respondent is non-responding in a given wave, SwHHIDPN is set to plain missing (.).

There are spouse versions of most Respondent variables. Each wave carries that wave's spouse's demographic and other information. For example, S1BDATE and S4BDATE are the birth dates for the Wave 1 and Wave 4 spouses, respectively. If the spouse in Wave 4 is the same as the spouse in Wave 1, these dates will be identical. But if the spouse in Wave 4 is different from the spouse in Wave 1, these will probably be different dates. If these spouse variables are missing because the Respondent is not married or partnered, they are set to SAS special missing .U. If they are missing because the Respondent's spouse or partner did not respond, they are set to a .V missing.

### Exit Interview Variables

RESHHIDPN is the spouse ID corresponding to SwHHIDPN at the time of the Respondent's death. Like SwHHIDPN, RESHHIDPN is a numeric ID variable derived from HHID and the spouse person number found on the Tracker file.

3.Hrs-Hrs overlap		6

### How Constructed

Around 100 individuals responded to HRS 1992 (W1) but were AHEAD eligible, and their households were given to the AHEAD sample. From 1993 on they are treated as AHEAD cases. On this file these cases are identified by their AHEAD IDs, and are linked to their HRS 1992 data. These are the only AHEAD entry cohort Respondents with any W1 data. These are "HRS-AHEAD" overlap cases and are identified by RAOVLAP (=1).

One case is married to an HRS-AHEAD overlap case in Wave 1 but not identified as an overlap on the Tracker file. We flag them as an HRS-AHEAD overlap case (RAOVLAP = 1) with RAOHSID = 20582020 and HHIDPN = 204940020. The only wave to which this case responds is Wave 1.

In addition, a few individuals within the AHEAD sample married someone from a different AHEAD household. These cases have one AHEAD ID for early waves, but are assigned a new one after the within-sample marriage. This file identifies these Respondents by their most recent AHEAD ID. RAOVRYR gives the last year in which the original HHIDPN is assigned, i.e., the last interview before the within-sample marriage. For example, if someone married another AHEAD sample member in a different household between 1995 and 1998, RAOVRYR=1995. These are "AHEAD-AHEAD" overlap cases, and are identified by RAOVLAP as well (=2).

Also in 2004, two households were identified and selected to be in the HRS survey. Both these households were 2-person households containing a married couple. However, there is a lag between when a household is identified and when they actually start to answer survey questions. So, it was 2010 before they actually responded to any HRS survey questions. By 2010, these households had split and so, in the 2010 Core data we had the following IDs HHIDPN=526934010 split from HHIDPN=525520010 and HHIDPN=529766010 split from HHIDPN=520845010.

By 2012, these couples had reunited and so in the 2012 Tracker file, their IDs change from HHIDPN=526934010 to HHIDPN=525520020  
HHIDPN=529766010 to HHIDPN=520845020

In the RAND HRS data products, these cases are referenced by their 2012 IDs. The IDs they had in the 2010 Core data can be found in RAOHSID. Also, they can be identified by RAOVLAP=3.

In 2018, two Respondents married another HRS Respondent. HHIDPN=906126010, who entered the survey in 2010, married HHIDPN=906543010. We changed HHIDPN=906126010 to be HHIDPN=906543020 and set RAOHSID=906126010, RAOVLAP=3 and RAOVRYR=2010. HHIDPN=544849010, who entered the survey in 2016, married HHIDPN=540162010. We changed HHIDPN= 544849010 to be HHIDPN=540162020 and set RAOHSID=544849010, RAOVLAP=3 and RAOVRYR=2016.

For both cases we set the sub-household ID to 1 until they marry in 2018, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2018. For example, for HHIDPN=540162020, H13HHID=5401621 and H14HHID= 5401620.

In 2020, one Respondent married another HRS Respondent. HHIDPN=541986010, who entered the survey in 2016, married

HHIDPN=541110010. We changed HHIDPN=541986010 to be HHIDPN=541110020 and set RAOHRSID=541986010, RAOVRLAP=3 and RAOVRAYR=2016. We set the sub-household ID for HHIDPN=541110020 to 1 until they marry in 2020, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2020. For example, for HHIDPN=541110020, H13HHID=5411101, H14HHID=5411101, and H15HHID= 5411100.

RAOAHID is the AHEAD HHIDPN for the HRS-AHEAD overlap Respondents, and the original AHEAD ID for AHEAD-AHEAD overlap Respondents. HAOAHDHH gives just the HHID portion of RAOAHID. On this file, HHIDPN (numeric), RAHHIDPN (character), and RAOAHID (numeric) are all equal for HRS-AHEAD overlap cases.

For AHEAD-AHEAD overlap cases, HHIDPN and RAHHIDPN are the most recent AHEAD ID, different from the original one found in RAOAHID. RAOAHID matches the OVHHID and OVPN found for the AHEAD-AHEAD overlap cases on the Tracker file, and the HHID and PN found in the core data for interviews up to and including RAOVRAYR. HHIDPN and RAHHIDPN match the HHID and PN found in the core data for interviews after RAOVRAYR.

RAOHRSID is the HRS HHIDPN for the HRS-AHEAD Respondents. It is also the 2010 ID for the MBB-MBB overlap Respondents. RAOHRSID is the HHIDPN that identifies the Respondent in the 1992 or 2010 Public Use Data, and by OVHHID and OVPN on the Tracker file.

For the HRS-AHEAD overlap cases the HwHHID and HwHHIDC variables reflect the AHEAD household identifier in all waves. For the AHEAD-AHEAD overlap cases, HwHHID and HwHHIDC reflect the actual AHEAD sub-household for the Respondent in each wave. So, for example, if the Respondent was in household 2000000 in 1995 and married into household 2900000 in 1998, H3HHID would be 2000000 and H4HHID would be 2900000.

H1OHRSHH is the HRS Wave 1 HHID plus sub-household for overlap Respondents. For AHEAD-AHEAD overlap cases H1OHRSHH is set to zero.

For non-overlap cases, all overlap IDs and RAOVRLAP are set to zero.

The spouse overlap flag and identifiers are taken from the Wave "w" spouse's variables, i.e., from the Wave "w" spouse's RAOVRLAP, RAOAHID, RAOHRSID, and RAOVRAYR.

## Cross Wave Differences in Original HRS Data

Tracker identifies all the AHEAD-AHEAD overlap cases and HRS-AHEAD overlap cases.

## How Constructed

This variable gives the response and mortality status of the Respondent at each wave. Respondents are identified by code 1, non-Respondents by codes 0, 4-7 and 9.

Mortality status is taken from the Tracker file. Known alive and presumed alive are both treated as indication that the Respondent is living. Non-response code 4 means that the Respondent is alive so far as we know, but did not respond. A code of 5 means that the Respondent died between the last interview and the current one, and 6 means that the Respondent had died before a previous wave. A code of 9 means that we don't know if the individual is alive or not; Tracker indicates this in the xALIVE variables for each wave. However, Tracker indicates some individuals are alive at a subsequent interview. We carry the living status back in these cases.

The xALIVE variable on the Tracker file is sometimes zero or missing before an individual enters the sample, or when an individual has been dropped from the sample. In these cases, if the Tracker variable xINSAMP indicates that the Respondent has not entered the sample because the cohort has not yet been interviewed, or the Respondent marries into the sample at a later wave (xINSAMP=2 or 3), then RwiWSTAT is set to zero. If the Respondent has been dropped from the sample because they were eligible to be an HRS-AHEAD overlap case but never responded to AHEAD (xINSAMP=4); alive but asked to be dropped from the study before the wave (xINSAMP=6); or for other reasons (xINSAMP=8); then RwiWSTAT is set to 7.

SwiWSTAT gives the response and mortality status of the current wave's spouse at each wave, if available. It is taken from the spouse's RxiWSTAT if the spouse appears on the Tracker file. Note that when a spouse dies, the spouse interview status for the surviving spouse will have a code of .U=Respondent unmarried if the widow does not remarry. A .V missing code indicates that there is no information in the Tracker file on why the spouse did not respond.

Note also that SxiWSTAT is set to plain missing (.) if an individual did not respond at a particular interview, including if they died.

## Cross Wave Differences in Original HRS Data

In the Tracker file, the xALIVE flag is sometimes zero or missing when an individual has been dropped from the sample. The xINSAMP code indicates why someone is dropped from the sample. In these cases, xINSAMP indicates why the Respondent has been dropped from the sample. Reasons are they were eligible to be an HRS-AHEAD overlap case but never responded to AHEAD (xINSAMP=4); alive but asked to be dropped from the study before the wave (xINSAMP=6); or for other reasons (xINSAMP=8).

## How Constructed

RwPEXIT indicates whether an Exit or Post-Exit Interview was administered this wave. We simply recode xIWTYPE directly from the Tracker file. A 0 means no Exit or Post-Exit Interview was administered this wave. A 1 means an Exit Interview was administered this wave and a 2 means a Post-Exit Interview was administered this wave.

REXITWV indicates the wave when the Exit Interview was administered. REPEXITWV1-REPEXITWV3 indicate the waves when the first, second and third Post Exit Interview was administered.

A respondent can have multiple Post-Exit Interviews but usually only one Exit Interview. An exception to this are HHIDPN=11863010 and 203802010. Both of these cases had Exit Interviews in 1998 and 2000. After consultation with HRS we are keeping the 1998 interview as it is closer to the Respondent's death.

## How Constructed

HACOHORT identifies the cohort in which the household was originally sampled. RACOHBYR identifies the cohort a Respondent fits into based on birth year.

There are seven birth year cohorts in the HRS: 1) AHEAD, born before 1924; 2) the Children of Depression (CODA), born 1924-1930; 3) HRS, born 1931-1941; 4) War Babies (WB), born 1942-1947; 5) Early Baby Boomers (EBB), born 1948-1953; 6) Mid Baby Boomers (MBB), born 1954-1959; and 7) Late Baby Boomers (LBB), born 1960-1965. The HRS sample was interviewed separately in 1992, 1994, and 1996. The AHEAD sample was interviewed separately in 1993 and 1995. The two studies were merged and the CODA and WB cohorts added in 1998. The EBB cohort was added in 2004. The MBB cohort was added in 2010. The LBB cohort was added in 2016.

HACOHORT does not necessarily reflect a birth year range, but indicates when and how the household entered the study. The RACOHBYR variable indicates which cohort a person falls into based on birth year. In this version of the RAND HRS Longitudinal File, all entry cohorts - HRS, AHEAD, CODA, WB, EBB, MBB and LBB - are included.

HACOHORT is assigned based on both response patterns and variables in the raw data that identify the cohort. HRS/AHEAD Overlap cases are identified as a separate category of their own. Please see the RAOVRLAP variable description for more information on these cases.

RACOHBYR is assigned based on RABYEAR. Those with birth years before 1924 are set to the AHEAD cohort, 1924-1930 are set to the CODA cohort, 1931-1941 are set to the HRS cohort, 1942-1947 are set to the WB cohort, 1948-1953 are set to the EBB cohort, 1954-1959 are set to the MBB cohort and 1960-1965 are set to the LBB cohort. If birth year is missing, then RACOHBYR is missing. If birth year is after 1965, then RABCOHBYR is set to zero.

SwCOHBYR is taken from the Wave "w" spouse's value for RACOHBYR, i.e., based on the spouse's birth year.

See also RAHRSAMP, which identifies age-eligible members of the HRS cohort (HACOHORT=3 and RACHOBYR=3) who responded to HRS 1992, and RAAHDSMP, which identifies age-eligible members of the AHEAD cohort (HACOHORT=1 and RACOHBYR=1) who responded to AHEAD 1993.

NOTE: At least one Respondent in a household should have a birth year appropriate for the cohort (though this is not always the case), but spouses may not. From the HRS documentation on the weights, it appears that weights were assigned based on birth year, regardless of how a person entered the sample, beginning in 1998.

## How Constructed

These files contain observations for any individual who responded to any of the HRS or AHEAD waves, regardless of birth year.

RAHRSAMP identifies HRS-eligible individuals defined as those who are age-eligible and responded to Wave 1. HRS age-eligible individuals are those born from 1931 to 1941, according to RABDATE. A "1" indicates that the individual is HRS-eligible, and a "0" indicates that they are not. The spouses of individuals in this sample may or may not be in the sample as well.

RAAHSMP identifies AHEAD-eligible individuals defined as those who are age-eligible and responded to Wave 2A. AHEAD age-eligible individuals are those born prior to 1924, according to RABDATE. A "1" indicates that the individual is AHEAD-eligible, and a "0" indicates that they are not. The spouses of individuals in this sample may or may not be in the sample as well.

The SwHRSAMP and SwAHSAMP variables indicate whether the Wave "w" spouse or partner is also in these files as a Respondent, i.e., whether the spouse is HRS or AHEAD age-eligible and responded to Wave 1 or Wave 2A, respectively. A "1" indicates that the spouse is in the sample, and a "0" indicates that they are not.

See also HACOHORT, which identifies how the household entered the study, regardless of Respondent age, and RACOHBYR, which identifies which cohort a Respondent fits into based on birth year.

### Descriptive Statistics

Variable Name	N	Mean	Std Dev	Minimum	Maximum
RAWTSAMP	12652	0.76	0.26	0.3	1.0
RAESTRAT	42405	32.08	18.28	1.0	80.0
RAEHSAMP	42405	1.49	0.50	1.0	2.0

### How Constructed

The sampling weight (RAWTSAMP) is taken directly from HRS 1992 variable V11, and is available only for HRS cohort Respondents in 1992. RAESTRAT and RAEHSAMP are taken directly from the Tracker variables STRATUM and SECU, respectively. These variables identify the stratum and half-sample respectively that can be used in calculating sampling error. They are described in the Tracker file documentation, and in [HRS Sample Evolution: 1992-1998](#) under Section "2g. Sample Error Computation."

## How Constructed

The household weights are taken directly from the Tracker file.

In 2010 HRS updated the household weight variables, due to a change in the CPS weights, and in part due to a calculation error.

An HRS analysis shows that these revisions do not substantially alter the weights, and do not significantly affect weighted distributions of key variables. Analyses done with the earlier versions of sampling weights should not in general require revision. Some possible exceptions include analyses that present population estimates (counts or percentages) for the 1995 AHEAD cohort or for the EBB non-minority (White/other) sample. Analyses that compare the EBB non-minority cohort to other subgroups may also be affected by the new weights. The full report can be found on the HRS website in the data description for the tracker file.

ACS, the primary data source for HRS post-stratification since 2004, started counting residents of most group quarters, which

include nursing homes, and providing person weights beginning in 2006. This allows HRS to use ACS to post-stratify both community residents and nursing home residents in one step. Therefore, starting 2016, HRS post-stratifies community-dwelling respondents using the ACS 1-year Public Use Micro Sample (PUMS) data from the year corresponding to the survey year. Because ACS PUMS does not include nursing home as a separate category, the nursing home resident post-stratification uses the ACS 5-year Summary File (SF) and intercensal estimates of nursing home residents. Consistent with past years, households where the only member or households where both members were in nursing homes are assigned zero values for the household weight. The full report can be found on the HRS website in the data description for the Tracker file.

### **Cross Wave Differences in Original HRS Data**

The household weights on the Tracker file are based on WGTBYR, which may differ from the Respondent's BIRTHYR used as the basis for birth year derived on these files. If the WGTBYR for someone in the HRS cohort sample (see HACOHORT) is outside of 1931-1941 or missing for all Respondents in a household, then the household may have a zero weight in W1, but still be HRS eligible (someone born 1931-1941) according to the household member's BIRTHYR. The same is also true for the AHEAD sample, the only difference being that these individuals were born prior to 1924. WGTBYR was provided as a variable on Tracker V2.0 but is not included in the current file. Other variables are available on the current Tracker which may help analysts determine why weights are not as expected. They are xWHY0WGT (where "x" is A through H depending on the interview year, available 1992-2002), xWHY0HWT (beginning in 2004), and WTCOHORT, which gives the birth cohort used for calculating weights.

The weights are structured to match the CPS from 1992-2002 and the ACS from 2004 forward, which includes living, non-institutionalized Respondents. A household where the only or both Respondents are institutionalized at the time of the interview (e.g., living in a nursing home) will have zero household weights for that wave.

HRS Respondents who were given to the AHEAD study (overlap households) are assigned a weight of zero for HRS Wave 1.

Thus, there are cases where Respondents in a given wave have zero household weight for the wave on these files.

Note also that in HRS 1998, the AHEAD and HRS cohorts are combined, and the CODA and WB cohorts are added. The weights derived for waves from 1998 forward used Respondents from ALL cohorts (age-eligible for the entry cohort or not) to match the CPS/ACS-reported population sums. This means that some of the weight for the HRS birth year entry cohort is assigned to Respondents in other cohorts who happen to have been born 1931-1941, and some of the weight assigned to HRS birth year entry cohort Respondents outside the 1931-1941 range, accounts for some of the weight for other birth year entry cohorts.

## How Constructed

The person-level weights are taken directly from the Tracker file and assigned to `RwWTRESP`. The person-level weights apply to those residing in the community, so are zero for those living in a nursing home.

From Wave 5, HRS provides weights for individuals living in a nursing home. These weights are provided in `RwWTR_NH`. For those not living in a nursing home, these weights are zero.

`RwWTCRNH` is the person-level weight and the nursing home weight combined. From Wave 1 to 4, there is no nursing home weight so `RwWTCRNH` equals `RwWTRESP`.

From Wave 5, for those not living in a nursing home, `RwWTCRNH` equals `RwWTRESP` and for those living in a nursing home, `RwWTCRNH` equals `RwWTR_NH`.

The spouse's person-level weight is taken from the Wave "w" spouse's variable, i.e., from the Wave "w" spouse's `RwWTRESP`, `RwWTR_NH` or `RwWTCRNH`.

In 2010 HRS updated the weight variables, due to a change in the CPS weights, and in part due to a calculation error.

An HRS analysis shows that these revisions do not substantially alter the weights, and do not significantly affect weighted distributions of key variables. Analyses done with the earlier versions of sampling weights should not, in general, require revision. Some possible exceptions include analyses that present population estimates (counts or percentages) for the 1995 AHEAD cohort, or for the EBB non-minority (White/other) sample. Analyses that compare the EBB non-minority cohort to other subgroups may also be affected by the new weights. The full report can be found on the HRS website in the data description for the Tracker file.

## Cross Wave Differences in Original HRS Data

The standard HRS weights are structured to match the CPS from 1992-2002 and the ACS from 2004 forward, which includes living, non-institutionalized Respondents. HRS sets these person-level weights to zero for those not age-eligible, living outside the U.S., or living in a nursing home. From 2000, HRS provides separate person-level weights for nursing home residents. From 2016, HRS post-stratifies community-dwelling respondents using the ACS 1-year Public Use Micro Sample (PUMS) data from the year corresponding to the survey year. Because ACS PUMS does not include nursing home as a separate category, the nursing home resident post-stratification uses the ACS 5-year Summary File (SF) and intercensal estimates of nursing home residents.

The person-level weights on the Tracker file are based on `WGTBYR` which differ from the Respondent's `BIRTHYR` used as the basis for birth year derived on these files. If the `WGTBYR` for someone in the HRS cohort sample (see `HACOHORT`) is outside of 1931-1941 or missing, then a Respondent may have a zero weight in `W1`, but still be HRS eligible (someone born 1931-1941) according to `BIRTHYR`. The same is also true for the AHEAD sample, the only difference being that these individuals were born prior to 1924. `WGTBYR` was provided as a variable on Tracker V2.0, but has not been included on more recent versions of Tracker. Other variables available on more recent versions of Tracker may help analysts determine why weights are not as expected. They are `xWHY0WGT` (where "x" is A through H depending on the interview year, available 1992-2002), `xWHY0RWT` (beginning in 2004), and `WTCOHORT`, which gives the birth cohort used for calculating weights.

A Respondent who is institutionalized, e.g., in a nursing home, at the time of the interview will have a zero person-level weight for that wave.

HRS Respondents who were given to the AHEAD study (overlap households) are assigned a weight of zero for HRS Wave 1.

Thus, there are cases where Respondents in a given wave have a zero person-level weight for the wave on these files.

Note also that in HRS 1998 the AHEAD and HRS cohorts are combined, and the CODA and WB cohorts are added. The weights derived for waves from 1998 forward used Respondents from ALL cohorts (age-eligible for the entry cohort or not) to match the

CPS/ACS-reported population sums. This means that some of the weight for the HRS birth year entry cohort is assigned to Respondents in other cohorts who happen to have been born 1931-1941, and some of the weight assigned to HRS birth year entry cohort Respondents outside the 1931-1941 range, accounts for some of the weight for other birth year entry cohorts.

### How Constructed

HwHHRESP is the number of individuals in the household who actually responded at each wave. It counts the Respondent and spouse, if any, and if the spouse responded, takes on a value of 1 or 2. Individuals with a value greater than zero for INWw are counted by wave-specific household, i.e., by a sub-household ID, which is included in HwHHID.

The value is missing if an individual did not respond in Wave 'w.' Thus, HwHHRESP is simply an indicator of whether the individual is the only Respondent in the household or not.

## How Constructed

HwCPL indicates whether this household is treated as a couple household or not. Households in HRS can consist of a single Respondent or a couple. HwCPL is set to "1" if the Respondent is married (RwMSTAT or RwMSTATH is married or partnered), partnered (RwMPART=1), or if there are two Respondents in the wave-specific household (HwHHRESP=2). Otherwise a single Respondent is assumed, and HwCPL is set to zero. As with most other RAND HRS variables, HwCPL is missing in waves where the Respondent does not respond.

## How Constructed

In couple households, household level questions about finances are answered by one individual designated the "Financial Respondent," and questions about family are answered by the individual designated the "Family Respondent." The Financial Respondent may be the same as the Family Respondent, or not, depending on the household. In single households, the only Respondent is both the Financial and Family Respondent.

RwFINR and RwFAMR indicate whether the Respondent is the designated Financial and Family Respondent, respectively. These flags are set to "1" if the designated Respondent, or "0" if not.

HwANYFIN indicates if any individual in the household is the Financial Respondent, and HwANYFAM indicates the same for the Family Respondent. A value of "0" in HwANYFIN or HwANYFAM indicates that there is no Financial or Family Respondent, respectively, and thus no household level information on the relevant topics. HwANYFIN and HwANYFAM are set to .S for the deceased Respondents in Wave 2 in previous versions of RAND HRS Longitudinal File. We exclude the W2 deceased Respondents in this version.

SwFINR and SwFAMR are taken from the Wave "w" spouse's value for RwFINR and RwFAMR, respectively.

HwPICKHH can be used to extract a household level file (i.e., one for each sub-household in the core data) by selecting records where HwPICKHH=1. This will select all individuals in single-Respondent households and just the Financial Respondent in couple households. For some households there is no Financial Respondent. HwPICKHH selects a Respondent for every household that participated in a given wave, regardless of whether a Financial Respondent is present. For couple households where there is no Financial Respondent, HRS sometimes assigns this role based on the variable xPN\_FIN (FINANCIAL RESP PERSON NUMBER). We set HwPICKHH=1 for that Respondent. Otherwise, we set HwPICKHH=1 for the Respondent in the household who is not the Family Respondent. If no Family Respondent is assigned, we set HwPICKHH=1 for the Respondent with the lowest PN. Please note that for some analyses, selecting a different record in couple households may be more appropriate. The analyst will need to determine this based on their research goals.

As stated in the "Household Identifier" section, there are a few households in Wave 3H that appear to be reunited based on answers to questions in the CoverSheet section. They are reunited in Wave 4 in the public use HRS core data, but have different sub-household IDs in Wave 3. We reunite them in Wave 3 in the RAND HRS Longitudinal File. These households are: 17520 (PNs 010 and 040), 22999 (PNs 010 and 020), 40609 (PNs 010 and 020), 40441 (PNs 010 and 020), 50945 (PNs 010 and 040). These cases will have different sub-household IDs in H3HHID from the ESubHH found in the Tracker and core 1996 files. The spouse PNs will also differ. For households 22999, 40441, and 50945, H3PICKHH will select both members from each household, since each member of the couple is flagged as the Financial Respondent. We did not select just one member from each household to go through the imputation process, but processed their responses as is. Therefore, they may each give different responses about their income and assets.

## REPROXYSP: EXIT Proxy is spouse

Value	
.Y=No Exit Interview, No De	24500
.Z=No Exit Interview, Death	1394
0. No	11224
1. Yes	5287

## REPROXYREL: EXIT Proxy relationship to R

Value	
.D=DK	2479
.M=Oth missing	1
.Y=No Exit Interview, No De	24500
.Z=No Exit Interview, Death	1394
2. Spouse/Partner	5287
3. Son	2011
4. Stepson Or Son Of Partne	43
5. Spouse/Partner Of Daught	47
6. Daughter	3978
7. Stepdaughter Or Daughter	116
8. Spouse/Partner Of Son	196
9. Grandchild Of R Or Sp/P	286
15. Brother	179
17. Sister	459
19. Other Relative	880
20. Other Individual	489
23. Paid Helper	16
24. Professional	39
33. Sp/P Of Grandchild	5

## How Constructed

### Core Interview Variables

RwPROXY is set to "1" if the interview is by proxy in wave "w." It is set to "0" if the Respondent is not a proxy. Proxy status is taken directly from the Tracker file.

The spouse's proxy flag is taken from the Wave "w" spouse's variable, i.e., from the Wave "w" spouse's RwPROXY.

### Exit Interview Variables

REPROXYSP is a flag variable indicating whether the Exit Interview was completed by the Respondent's spouse or not. It is set to "1" if the Exit Interview is by the surviving spouse. It is set to "0" if the proxy is not a surviving spouse.

REPROXYREL is the relationship of the proxy to the deceased Respondent.

## Cross Wave Differences in Original HRS Data

## Exit Interview Variables

From Wave 2 to Wave 5, there is only one question which asks if the proxy is the surviving spouse. If the proxy is not the surviving spouse, we do not know the relationship of the proxy to the deceased Respondent, so REPROXYREL is coded .D for "don't know." From Wave 6 forward, there is an additional question that asks about the relationship of the proxy to the deceased Respondent. There are a small number of cases where the proxy reports that they are not the surviving spouse in the proxy question and then reports they are the spouse in the relationship question. For these inconsistencies, we keep REPROXYSP = 0, and REPROXYREL is coded .D for "don't know."

## HRS Variables Used

## How Constructed

### Core Interview Variables

These variables are derived from the beginning and ending interview dates. The RwiWBEG variables are the beginning interview dates and the RwiWEND variables are the ending interview dates. In some waves only one interview date is given, and it is used as both the beginning and ending date.

The RwiWMID variables are derived as the midpoint between the beginning and ending interview dates. From Wave 6 forward, and in Waves 2A and 3A of AHEAD, there is only one interview date given; this is used for the beginning, ending, and midpoint interview date.

Note that most beginning and ending interview dates are the same. In the cases where they differ, the interview is usually suspended near the beginning of the survey questions and picked up days, weeks, or months later. According to ISR, the ending interview date is usually applicable to most of the interview, particularly in the later sections.

RwiWBEG, RwiWMID, and RwiWEND are in SAS date format, which is the number of days relative to January 1, 1960. RwiWENDM and RwiWENDY provide the end interview month and year, respectively, not in SAS date format.

The interview day is available only for Waves 1 and 2H, and for Wave 2A of AHEAD. RwiWBEGF, RwiWMIDF and RwiWENDF are flags that describe any anomalies found in the data. From Wave 3 forward, the 15th of the interview month was used. These variables are SAS dates (# days from 1/1/1960).

For 4 cases in HRS 1998, and for 1 case in HRS 1996, the interview year appears as 1980. For the 1998 cases, the median interview month and year for all other cases with the same version of the questionnaire is used. For the 1996 case, 6/1996 is used.

For Waves 1, 2, 3A, 4, and from Wave 6 the Tracker variables were used instead of the corresponding raw variables for the beginning interview month and year.

For Waves 3H and 5, the Tracker variables were used instead of the corresponding raw variables for the ending interview month and year.

The spouse's variables are taken from the Wave "w" spouse's variables, i.e., from the Wave "w" spouse's RwiWBEG, RwiWBEGF, RwiWEND, RwiWENDF, RwiWMID, and RwiWMIDF.

### Exit Interview Variables

Exit Interview dates are found in REIWBEG, REIWMID, and REIWEND for the beginning, midpoint, and ending dates, respectively. These variables are derived from the beginning, midpoint, and ending interview dates from the Exit Interview and Tracker files.

In Waves 2H, 3, and from Wave 6 forward, there is only one interview date given; this is used for the beginning, ending, and

midpoint interview date. REIWMIDF is a flag variable that signals when beginning and ending interview dates are not the same; when the months and years are different, and when the actual day is different.

REIWBEG, REIWMID, and REIWEND dates are stored as numbers given by the number of days since (or before) January 1, 1960.

## Core and Exit Differences

The Core Interview measures include flags indicating anomalies in the interview dates for the beginning and ending interview for Waves 1 and 2.

## Cross Wave Differences in Original HRS Data

### Core Interview Variables

In Waves 1 and 2H, the month, day, and year that the interview began and ended are given. In Wave 2A of AHEAD, the month, day, and year that the interview began are given, but not the corresponding ending dates. This is also true for Wave 3A, the only difference being that the day the interview began is also not given. From Wave 3H forward, the day of interview is not available.

Also, in Waves 3H and 4, two interview months are given which are not labeled beginning or end. A comparison year of the two months determined which were the beginning and ending interview dates. For 4 cases in HRS 98, and for one case in HRS 96, the interview year appears as 1980. Also, in Waves 3H and 4, two interview months are given which are not labeled beginning or end. A comparison of the two months determined which were the beginning and ending interview dates. For 4 cases in HRS 98, and for one case in HRS 96, the interview year appears as 1980.

In Wave 5 two interview months are given, which are labeled beginning and current month.

For Waves 1, 2, 4, and from Wave 6, the Tracker variables that correspond to the beginning interview month and year are available.

For Waves 3H and 5, the Tracker variables that correspond to the ending interview month and year are available.

### Exit Interview Variables

From Wave 3 forward, we use Tracker data for beginning interview months and years. We do not have an interview start date so we impute the 15th day of the month. For Wave 2H, we use the recorded day instead of imputing the 15th day of the month.

Waves 2H, 4, and from Wave 6 forward, we utilize the interview ending date for month and year. In Waves 3 and 5, we use the Tracker only interview month and year. For Respondents with interviews in these waves, their REIWBEG and REIWEND are equal. For Wave 3 forward, we do not have the interview end date, therefore we impute the 15th day of the month.

## How Constructed

RABMONTH and RABYEAR are the Respondent's reported birth month and year, respectively. RABDATE is the SAS date format of the birth date. The SAS date format is the number of days since 1/1/1960. If a date is before 1960 the SAS date is a negative number; if after 1960 it is a positive number.

The Respondent birth date is derived by searching all waves of data and Tracker for a non-missing date. The first non-missing birth month is used beginning with the Tracker BIRTHMO and BIRTHYR, and then the core data from Wave 1 forward, consecutively.

To calculate RABDATE, a day must also be used. If the birth month is given, the 15th is used as the day. If the month is missing but year is given, the day is July 1st and RABMONTH is set to 7. If the year is missing, the birth date is missing. RABFLAG indicates if the birth month is missing.

Spouse birth date is taken from the Wave "w" spouse's self-reported birth date, i.e., from the spouse's RABMONTH, RABYEAR, and RABDATE. If the spouse never responded, then the birth month and year of spouse as reported by the Respondent in Wave "w" is used.

1. One Or Two Hours (Or No	1452
2. Less Than A Day	1069
3. Less Than A Week	2613
4. Less Than A Month	3101
5. Less Than A Year	4055
6. More Than A Year	3464

## How Constructed

### Core Interview Variables

RADYEAR and RADMONTH are the year and month of death ascertained by HRS and populated by either the Exit Interview or spouse reported year of death information. These death dates are taken directly from the Tracker file. RADDATE is the SAS date format of the Death date. RADSRC is the source of the death date variables. RADTIMDTH is the number of months between the last

core interview and death date.

To calculate RADDATE, a day must also be used. If the death month is given, the last day of the month is used as the day. If the month is missing but year is given, and the year is the same as the last live interview, the month and day are set using the mean date between the last interview date and the last day of the year. Otherwise if the month is missing, the death date is set to July 1st of the death year. If the year is missing, the death date is missing.

Spouse death information is taken from the Wave "w" spouse's death date, i.e., from the spouse's RADDATE, RADSRC or RADTIMTDH.

### Exit Interview Variables

REPLDEATH indicates where the Respondent was at the time of death. It is constructed from an Exit Interview question and the response options are: a hospital, a nursing home, home, hospice, assisted living facility/rest home/retirement home/senior care home and other. In Wave 2H, place of death is not asked, therefore REPLDEATH is coded .Q for "not asked this wave."

REXPDEATH indicates if the Respondent's death was expected or unexpected. It is derived from the cover sheet question, "Was the death expected at about the time it occurred or was it unexpected...?" The response options are expected, unexpected, and other.

RET2DEATH is the length of time between start of final illness and death. All waves are coded as intervals of time from one or two hours to more than a year.

## Cross Wave Differences in Original HRS Data

### Exit Interview Variables

Place of Death was not asked in Wave 2H. In all other waves, the Exit Interview asks, "At the time of death, was [she/he] in a hospital, in a nursing home, at home, in a hospice, or what?" From Wave 6 forward, the category for assisted living facility/rest home/retirement home/senior care home was added as a response. For Wave 8, the code "Home" includes hospice care at home at the time of death.

In Wave 2H, the question to derive REXPDEATH was not asked. In Wave 3H, the skip pattern results in 75 percent of Respondents skipping this question. In all other waves this question was answered consistently.

## HRS Variables Used

### Exit Interview Variables

AHEAD 1995:	
N226	CS2cx.PLACE OF DEATH
N233	CS2jx.EXPECTED DEATH?
N235	CS2mx.TIME TO DEATH

## How Constructed

### Core Interview Variables

Age at the beginning of the interview (RwAGEM\_B) is calculated from the Respondent birth date and beginning interview date (RwIWBEG), in months and years. Age in years (RwAGEY\_B) is the integer portion of the number of months old divided by 12.

Age in months and years at the end of the interview (RwAGEM\_E and RwAGEY\_E) is calculated in the same way, but uses the ending interview date (RwIWEND). Age in months and years at the midpoint between the beginning and ending interview dates (RwAGEM\_M and RwAGEY\_M) is calculated in the same way, but uses the midpoint between interview dates (RwIWMID).

According to HRS, when there are different beginning and ending interview dates, most of the interview is usually conducted on the ending date. Thus, it is probably best to use the RwAGEM\_E and RwAGEY\_E variables for Respondent age at each interview.

From Wave 6 forward, and in AHEAD Waves 2A and 3A, the beginning and ending interview dates are always the same. In those waves, RwAGEY\_B, RwAGEY\_M, and RwAGEY\_E are all the same, as are RwAGEM\_B, RwAGEM\_M and RwAGEM\_E.

Age at death in months (RADAGE\_M) is calculated from the Respondent birth date (RABDATE) and death date (RADDATE). Age in years (RADAGE\_Y) is the integer portion of the number of months old at time of death divided by 12. If a Respondent does not have a death date, RADAGE\_M and RADAGE\_Y are set to .X.

See Birth Date (RABMONTH, RABYEAR, RABDATE) for a description of how the birth date is derived. See Interview Dates (RwIWBEG, RwIWEND, RwIWMID) for a description of how the beginning, ending, and midpoint interview dates are derived. See Death Date (RADMONTH, RADYEAR, RADDATE) for a description of how the death date is derived.

Spouse age is calculated using the spouse birth month and the Respondent's interview month at each wave.

Spouse birth date is taken from the Wave "w" spouse's birth date, i.e., from SwBDATE.

Spouse age at death (SwDAGE\_M, SwDAGE\_Y) is taken from the Wave "w" spouse's age at death.

### Exit Interview Variables

RESPAGEM\_B indicates spouse age at the beginning of the Exit Interview and is calculated from the spouse's birthdate and beginning Exit Interview date (REIWBEG), in months and years. RESPAGEY\_B indicates age in years and is the integer portion of the number of months old divided by 12.

RESPAGEM\_E and RESPAGEY\_E indicates spouse age in months and years at the end of the Exit Interview, and is calculated in the same way, but uses the ending Exit Interview date (REIWEND). RESPAGEM\_M and RESPAGEY\_M indicates age in months and years at the midpoint between the beginning and ending interview dates, and is calculated in the same way, but uses the midpoint between the Exit Interview dates (REIWMID).

The spouse's birthdate is constructed from the date on the Respondent's previous interview in the Core Interview. From Wave 4, if there is no data available in the Core Interview or the spouse status has changed from the Respondent's previous interview, we calculate spouse birthdate from the Exit Interview. In Wave 5, only month and year are available, so we impute the day to be 15.

### Core and Exit Differences

In constructing Exit Interview spouse age, we utilize the previous Core Interview spouse age. However, in most waves, there is Exit Interview data for spouse age we use when we do not have the age in a previous interview or when the cover sheet section indicates a new spouse.

### Cross Wave Differences in Original HRS Data

#### Exit Interview Variables

In Waves 2H and 3, spouse age was not collected in the Exit Interviews.

In Wave 4 and from Wave 6 forward, if the data is not available in the Core Interview, we use the Exit data for spouse age.

In Wave 5, if spouse birth date is not available in the previous Core Interview, we fill in missing spouse age with Exit Interview data for spouse birth month and birth year. We impute birth day as the 15th of the month, and if month is missing we impute June.

## How Constructed

Gender is taken from the Tracker file.

Spouse gender is taken from the Wave "w" spouse's RAGENDER variable.

## Cross Wave Differences in Original HRS Data

Gender is reported in the Tracker file and in all waves. We only use the Tracker file in our derivation as it has the most up-to-date information.

Spouse gender is available in all waves, if the Respondent is married or partnered.

## How Constructed

Race is assigned by looking at reports from Tracker and all waves of data. The non-missing race variable from Tracker is used. If race is missing, then the most recent non-missing race from all waves is used.

SwRACEM provides the race of the Respondent's spouse or partner. It is taken from the Wave "w" spouse's RARACEM variables.

## Cross Wave Differences in Original HRS Data

Before Wave 8 race is asked at the Respondent's first interview. In Wave 8, the question format was changed to meet OMB guidelines. In particular, Respondents were allowed to report multiple races, and some categories that had previously been combined were separated. Also, if more than one race was reported, Respondents were asked which one they consider to be their primary race. The new format is asked only once of all Respondents, either in Wave 8 or the first wave after that in which a Respondent completed an interview.

## How Constructed

RAHISPAN indicates whether the Respondent is Hispanic. It is assigned by looking at reports from the Tracker file and all waves of data. The non-missing Hispanic variable from Tracker file is used. If RAHISPAN is missing, then the most recent non-missing Hispanic from all waves of data is used.

In the Tracker file variable, both Mexican-American and Other Hispanic are recoded to "1." The codes for the core data variables which indicate yes, for Hispanic, are recoded to "1", and no is recoded to "0".

SwhISPAN indicates whether the Respondent's spouse or partner is Hispanic. It is taken from the Wave "w" spouse's RAHISPAN variable.

## Cross Wave Differences in Original HRS Data

Before Wave 8, individuals are asked whether they consider themselves Hispanic or Latino at their first interview. In Wave 8, everyone is asked this question. From Wave 9, the question is asked if it's the first interview.

## How Constructed

### Core Interview Variables

RwCENREG gives the Census Region and RwcENDIV the Census Division of Respondent residence at wave 'w.' The Census Division of residence is provided in the HRS 1992-2020 Cross-Wave Census Region/Division and Mobility File, and in the core data for most waves. Census Division is recoded into the larger Census Regions.

If the residence location in the Geographic Region file variables is missing, we examine variables from the core data for location, if available. We then look at the spouse's residence from the Geographic Region file, and if the couple is living together, use it to fill missing variables as well. Finally, we examine variables indicating whether the household moved between waves, and if not, carry prior residence forward, or future residence back.

In the core data, location of residence is collected in the first interview for the entry cohort sub-sample, i.e., in Wave 1 for the HRS cohort, Wave 2A for the AHEAD cohort, Wave 4 for the CODA and War Babies cohorts, Wave 7 for the EBB cohort, Wave 10 for the MBB cohort, and Wave 13 for the LBB cohort. At subsequent interviews, questions ask whether the household moved, and if so, if the move was within the same area as the previous interview residence. If the household moved out of the area, the new location was collected. The new location is provided in the core data, except in Waves 2H and 3A.

Note that most of the time the Respondent and spouse live in the same Census Region, but occasionally the two regions differ.

The spouse's Census Region and Division are taken from the Wave "w" spouse's variables, i.e., from the Wave "w" spouse's RWCENREG and RWCENDIV.

### **Exit Interview Variables**

RECENDIV indicates the Census Division where the Respondent's death occurred. RECENDIV is constructed consistently across all waves from the Exit Interview question, "In what state and county did [he/she] die?" The HRS Core data codebook explains, "Code categories have been collapsed to protect participant confidentiality." The variable is masked; that is, recoded to one variable indicating the Census Region of death, with a code for non-U.S. deaths—"Not US/inc US terr."

RECENREG represents the Census Region in a collapsed version of Census Division; as Northeast, Midwest, South, West, or Other.

### **Core and Exit Differences**

The Core Interview questions are about the Census Division and Census Region of residence. The Exit Interview questions are about the Census Division and Census Region where death occurred.

### **Cross Wave Differences in Original HRS Data**

#### **Core Interview Variables**

Region of residence is provided in the Cross-Wave Census Region/Division file. Information on household location is available in the core data.

Location of residence is available in Wave 1 data for the HRS entry cohort, and in Wave 2A for the AHEAD entry cohort. In Wave 4, the War Babies and Coda cohorts are asked for the location of current residence, as this is their first wave in the study. In Wave 7, the EBB cohorts are asked for location of current residence. The MBB cohort is asked in Wave 10, and the LBB cohort is asked in Wave 13.

In Wave 2H for HRS cohort there is no question about the current location of residence. The only question asked is whether the household moved to a different residence since the date of the Wave 1 interview.

In Wave 3H and from Wave 4 forward, questions ask if the household is still in the same location as in the previous wave interview, and if not, whether it moved to the same area of that old address. If the household did not stay within the same area, the new location is asked. Wave 3A follows a similar sequence of questions, except that the new location was not asked.

#### **Exit Interview Variables**

In the Exit Interview, Waves 3, 10, and 11 include response options of "97 Other Country" for RECENDIV. This category is combined with "11. Not US/inc US terr."

## How Constructed

RwURBRUR provides the urbanicity of the Respondent's county of residence at Wave "w." The urbanicity is taken from the Beale codes in the [HRS 1992-2020 Cross-Wave Census Region/Division and Mobility File](#).

The values for RwURBRUR can be 1.Urban, 2.Suburban, or 3.Ex-urban (which also includes rural counties). If there is no match for the Rural-Urban code, a value of .N is assigned. There are currently three sets of Beale codes provided: 1993, 2003, and 2013. For each wave of data, the Beale code with the closest year is used in creating the RwURBRUR variable. If that value is missing, the next closest Beale code year is used. If that code is also missing, the furthest Beale code year is used. If the Beale code years are equidistant from the interview wave year, the most recent Beale code year is used first. The Beale codes provided in HRS's Cross-Wave Census Region/Division and Mobility File are consolidated from the [USDA's Rural-Urban Continuum Codes](#). USDA's full code list is available on their [website](#). The crosswalk for HRS's classifications is in the codebook of [HRS's Cross-Wave Census Region/Division and Mobility File](#).

The spouse's urbanicity (SwURBRUR) is taken from the Wave "w" spouse's variable, i.e., from the Wave "w" spouse's RwURBRUR.

## How Constructed

The years of education variable is assigned by looking at reports all waves of data and then from the Tracker. The first non-missing value from all waves of data is used. If RAEDYRS is missing, then the non-missing SCHLYRS variable from Tracker file is used.

The spouse variables SwEDYRS and SwEDYRF are taken from the Wave "w" spouse's RAEDYRS and RAEDYRF.

## Cross Wave Differences in Original HRS Data

In Wave 1, years of education is imputed. It is not imputed in any other wave.

## How Constructed

The highest degree is assigned by looking at reports from Tracker and all waves of data. The first non-missing value is used. If the Respondent reports 12 or fewer years of school, they are asked about a HS degree only. If the Respondent reports 13 or more years of school, they are asked about college degrees only, and if they do not have any, the assumption is completion of HS, but the data do not distinguish a diploma from a GED.

The detail of the higher-level degrees varies across waves. RweDEGRM is recoded to categories that are consistently available across waves. For degrees higher than BA, there are 2 categories: MA/MBA and MD/Law/PhD through Wave 7. In Wave 8, MD/Law/PhD is included in the "other" category, so cannot be identified separately. If a Respondent first responds in Wave 8, then MD/Law/PhD degrees will be coded as "other."

Overlapping categories occur for high school degrees where the information is sometimes incomplete, i.e., 1=GED, 2=HS and 3=HS or GED.

This variable combines the HS degree, any college degree, and highest degree. If it is missing from all waves, RAEDYRS is used to assign degree: 0-11=no degree; 12, 13=HS/GED; 14, 15=AA; 16, 17=BA.

The spouse variables SwEDEGRM and SwEDEGRF are taken from the Wave "w" spouse's RADEGRM and RADEGRF variables.

## Cross Wave Differences in Original HRS Data

The categories for higher level degrees (beyond BA) vary across waves. In Waves 1 and 2H, MA and MBA are coded separately. For Wave 2A, higher level degrees are indicated by two categories: "Advanced degree/non-professional" and "Advanced degree/professional." From Wave 3 forward, the MA and MBA categories were collapsed. In Waves 1, 2, 3H, 4 and 5 Law/MD and PhD are 2 separate categories. In Waves 3A, 6, and 7, these are collapsed into one category, Law/MD/PhD. From Wave 8 and forward, Law/MD and PhD are not identifiable; they are included in the "other" category.

The wording for degrees less than BA changes across waves. In Waves 1 and 2H it is "Associates." In Wave 2A, and from Wave 3 forward, it is "less than Bachelor's."

## How Constructed

Categorical education recodes the years of education, whether high school degree, and college degrees in a more general way than RAEDEGR. RAEDUC recodes dropouts, HS diplomas, and GEDs directly from RAEDEGR. If the Respondent has a high school diploma or GED and years of education over 12, RAEDUC is set to "some college." RAEDUC is also set to "some college" if the degree is less than a BA, or "other." If the Respondent has exactly 12 years of education but no college degree, then a high school diploma is assumed. If the college degree is a BA or greater, RAEDUC is set to "college and above."

The spouse variable SwEDUC is taken from the Wave "w" spouse's RAEDUC variable.

## Cross Wave Differences in Original HRS Data

The categories for higher level degrees (beyond BA) vary across waves. In Waves 1 and 2H, MA and MBA are coded separately. For Wave 2A, higher level degrees are indicated by two categories: "Advanced degree/non-professional" and "Advanced degree/professional." From Wave 3 forward, the MA and MBA categories were collapsed. In Waves 1, 2, 3H, 4 and 5, Law/MD and PhD are 2 separate categories. For Wave 3A, 6 and 7, these are collapsed into one category, Law/MD/PhD. From Wave 8 and forward, Law/MD and PhD are not identifiable; they are included in the "other" category.

The wording for degrees less than BA changes across waves. In Waves 1 and 2H it is "Associates." For Wave 2A, and from Wave 3 forward, it is "less than Bachelor's."

## How Constructed

These variables are assigned by looking at all waves of data for the first non-missing values. In Wave 1 and from Wave 4 forward, a question asks for the [father's/mother's] years of education. Wave 2H does not ask the question at all. In Wave 3H and in Waves 2A and 3A of the AHEAD sample, the question asks if they attended school for 8 or more years.

Wave 1 or Waves 4 and after, are used first, if not missing. If only Wave 3H data are available or for the AHEAD sample—Waves 2A and 3A, 7.5 years is assigned if less than 8 years, and 8.5 is assigned if 8 or more.

The spouse variables SwFEDUC and SwMEDUC are taken from the spouse's Wave "w" RAFEDUC and RAMEDUC variables, respectively.

## Cross Wave Differences in Original HRS Data

In Wave 1 the question is: "What is the highest grade of school your father completed?" Answers are given in years of school, 0-17.

In Wave 2H, the question is not asked at all.

In Wave 3H, and for the AHEAD sample, Waves 2A and 3A, the question is: "Did your father/mother attend 8 years or more of school?" and the possible answers are "yes" and "no."

From Wave 4 forward, the question is similar to the Wave 1 wording: "And what is the highest grade of school your father/mother completed?" with possible answers ranging from 0-17.

## How Constructed

### Core Interview Variables

This variable is created using current marital status reported for each wave. For Wave 3A of AHEAD, and from Wave 4 forward, a cleaned version of marital status is used, which fills missing marital status using cover sheet data and marital events reported between interviews.

The codes for separation and divorce are combined in Waves 2A, 3A, and 3H; a separate category is used for this ambiguous state. For all waves, RwmSTAT combines "Married, spouse absent" as one category, rather than separating spouse in institution vs. not. HRS Wave 1 imputations are not used at all.

From Wave 7 and forward, some cases report a marital status of annulled, which is treated the same as never married.

The RwmSTAT variables code partnerships, which override the actual marital status that is available for most cases from Wave 4 forward. Some cases report an unmarried status, but have a partner in the same household, particularly in Wave 2. RwmSTAT retains the reported unmarried status. RwmPART indicates the presence of a partner regardless of the RwmSTAT code. Please see RwmPART description for details.

The RwmSTATH variables do not code partnerships, and actual marital status replaces the partnership code if it can be determined. Please see the description of RwmSTATH variables for details.

The spouse variable SwmSTAT is taken from the spouse's data for Wave 'w.' It is set to .U if Respondent is unmarried or unpartnered or .V if the Respondent's spouse or partner did not respond in a given wave.

There are four individuals where discrepancies in reported marital status and partnership were found. These are resolved, and RwmSTAT and RwmPART are set based on examination of all available data for the individuals and their spouse/partners from all waves.

### **Exit Interview Variables**

REMSTAT indicates the Respondent's marital status at time of death. It is created using marital status reported in the Exit Interview.

The marital status codes follow the same categories as the Core Interview measure RwmSTAT: married, married (spouse absent), partnered, separated, divorced, widowed, and never married, and separated/divorced. Separated/divorced is a combined single code used only in Wave 3. However, separate categories for divorced and separated are used in all other waves. REMSTAT combines married and spouse absent as one category, rather than separating spouse in institution vs. not in institution.

From Wave 7 forward, some cases report a marital status of annulled which is treated as "never married."

REMSTAT codes partnerships, which override all other marital status.

### **Core and Exit Differences**

The Core Interview measure, marital status uses questions asked of the Respondent as well as questions asked of the spouse and/or partner. In the Exit Interview data, marital status uses only the proxy's responses for the Respondent.

### **Cross Wave Differences in Original HRS Data**

#### **Core Interview Variables**

The asking and coding of marital status differs from wave to wave. In Waves 1 and 2H Respondents are specifically asked their marital status as married, partnered, separated, divorced, widowed or never married. The marital status in the public use data also includes a "Married, spouse absent" status that is split between those whose spouse is in a nursing home, and whose spouse is not institutionalized. In Wave 2A, a single item is used to assess marital status. Response categories include married (spouse present), married (spouse absent), living with someone, separated/divorced, widowed, and never married. The separated and divorced categories are not coded separately.

In Wave 3H, the Respondent is not asked marital status; it is derived from preloaded marital status, and a series of questions in the Cover Sheet section. There is a "corrected" marital status included in the Wave 3H public use data. In addition, the separated and divorced statuses are not coded separately. In Waves 1, 2, and 3H, partnership overrides any other marital status. Marital status in

Wave 3A is also derived using questions from the cover sheet section. The separated and divorced statuses are in a single category, and partnership overrides any other marital status.

Beginning in Wave 4, all partnered and unmarried single Respondents are asked marital status. Through Wave 6, the status must be an unmarried status, treating separated as an unmarried category apart from divorced. Beginning in Wave 7, both married and annulled may be coded, in addition to the unmarried statuses allowed in prior waves. Marital status in the raw data is set to married or separated for Respondents determined to have these statuses from cover sheet section questions. There is no distinction made between spouse present and spouse absent in the raw marital status variable, but this information is available from other questions in the cover sheet section.

The cover sheet section sequence of questions that lead to a marital status and determination of "couplehood," are included in the data starting in Wave 3. These questions are examined to help set the cleaned marital status used in deriving RwmSTAT.

Respondents who have an unmarried to married transition between interviews, or vice versa, are asked about marriages and ends of marriages (divorce or widowhood) that may have occurred between interviews at all waves after the initial interview in which a Respondent appears.

From Wave 4 forward, some partners appear to have married based on these reported marital transitions. These cases often report "other" in response to the question about specific unmarried status; note that "married" is not allowed in response to this question in Waves 4 to 6. Cases with both a reported marital event and a report of "other" marital status are set to married in the cleaned versions of marital status used in deriving RwmSTAT.

### **Exit Interview Variables**

In Wave 2H, the proxy is asked about Respondent's marital status as married, partnered, separated, divorced, widowed, or never married. The marital status includes a married (spouse absent) status that is split between those whose spouse is in a nursing home and those whose spouse is not institutionalized. These are combined into one category which is married, spouse absent.

In Wave 3H, the Respondent is not asked marital status; it is derived from preloaded marital status and a series of questions in the cover sheet section. The separated and divorced statuses are coded in a single category. In Waves 2H and 3, partnership overrides any other marital status. Marital status in Wave 3A is derived by using questions from the cover sheet section, and there is a distinction for married spouse present and married spouse absent.

Beginning in Wave 4, all partnered and unmarried single Respondents are asked marital status. Through Wave 6, the status must be an unmarried status, treating separated as an unmarried category apart from divorced. Beginning in Wave 7, married or annulled are coded, in addition to the unmarried statuses. Marital status in the raw data is set to married or separated for Respondents using the response status from the cover sheet section. There is no difference made between spouse present and spouse absent in the raw marital status variable, however this information is available from other questions in the cover sheet section.

From Wave 7 forward, some cases report a marital status as annulled, which is treated as never married.

## How Constructed

### Core Interview Variables

Marital status RwmSTAT indicates partnership; that is, living with a partner who is not the Respondent's spouse. In addition, some cases report an unmarried status, but have a partner in the same household. Another living individual with the same HHID and sub-household ID on the Tracker file, or in the core data, indicates the presence of a partner when the Respondent gives an unmarried status. From Wave 4 forward, the "coupleness" code in the cover sheet section can also indicate a partnership. RwmPART indicates the presence of a partner regardless of the RwmSTAT code.

The spouse variable SwMPART is taken from the spouse's data for Wave 'w.' In some cases, the spouse and Respondent disagree as to whether they are married or partnered, so RwmPART and SwMPART are not always the same in a given wave. SwMPART is set to .U if the Respondent is unmarried and unpartnered or .V if the Respondent's spouse or partner did not respond in a given wave.

### Exit Interview Variables

REMPART is a yes/no marital status indicator of whether the Respondent was partnered at the time of death. We define partnered as living with a partner who is not the Respondent's spouse. From Wave 4 forward, a separate cover sheet code indicates partnership.

### Core and Exit Differences

Partnership is indicated by a marital status code in Waves 2H and 3 of the Exit Interviews. From Exit Interview Wave 4 forward, REMPART utilizes separate cover sheet data to code partnership.

In the Core Interview measure, partnership can be indicated by another living individual with the same HHID and sub-household ID on the Tracker file or if the core data indicates the presence of a partner when Respondent gives an unmarried status.

## Cross Wave Differences in Original HRS Data

### Core Interview Variables

Partnership is indicated by a marital status code in Waves 1 to 3H. From Wave 4 forward, it is indicated by a separate cover sheet section variable.

Partnership can also be indicated by a non-married status when the household is a couple, rather than single in any wave.

## Exit Interview Variables

In Waves 2H and 3, partnership is indicated by a marital status code in the Exit Interviews. From Wave 4 forward, REMPART utilizes separate cover sheet data.

## How Constructed

### Core Interview Variables

This variable is created using current marital status reported for each wave. For Wave 3A, and from Wave 4 forward, a cleaned version of marital status is used, which fills missing marital status using cover sheet data and marital events reported between interviews.

The RwMSTAT variables code partnerships, which override actual marital status. Before Wave 4, partnered couples were not asked for their unmarried status. Beginning in Wave 4, those not living with another, and those living as unmarried partners, were asked for their unmarried status. Please see the description of RwMSTAT and RwMPART variables for details.

The RwMSTATH variables are derived from RwMSTAT but do not code partnerships, and actual marital status replaces the partnership code, if it can be determined. For instance, because partners were specifically asked actual marital status from Waves 4 forward, many partner marital statuses can be carried back to prior waves if no intervening marital events have occurred. Marital events can also indicate marital status of a partnered Respondent, e.g., a number of partners report a widowhood or divorce, followed closely by a marriage to the partner. When the actual marital status cannot be determined RwMSTATH is set to an unknown unmarried status(=9). Marital status for partners can sometimes also be determined at their first interview from retrospective marriage

history information. From Wave 7 and forward, some cases report a marital status of annulled, which is treated the same as never married.

The codes for separation and divorce are combined in Waves 2A, 3A, and 3H; a separate category is used for this ambiguous state. Information from previous and subsequent wave marital status, marital events reported, marital history, and spouse marital status are used to distinguish between separation and divorce in these waves when possible. For all waves, this variable combines "Married, spouse absent" as one category, rather than separating spouse in institution vs not. HRS Wave 1 imputations are not used at all.

The RwmSTATF variables compare RwmSTATH with marital status reported in other waves, and those derived from marital history. For instance, some cases switch between unmarried statuses across waves, e.g., from divorced to never married. RwmSTATF flags these seemingly illogical differences, distinguishing between ever married and never married discrepancies, and those of other types.

RwmSTATH may have a value when RwmSTAT is missing. The analyst may want to fill RwmSTAT from RwmSTATH in these cases.

The spouse variable SwmSTATH is taken from the spouse's data for Wave 'w.' It is set to .U if the Respondent is unmarried or unpartnered or .V if the Respondent's spouse or partner did not respond in a given wave.

### **Exit Interview Variables**

REMSTATH indicates a Respondent's marital status without partnership at the time of death. It is constructed using the marital status reported in the Exit Interview (see REMSTAT). The marital status partnership code is replaced by an unmarried marital code. Wave 2H and 3 utilize cover sheet data, preload and previous interview marital codes. In all other waves, unmarried marital status and cover sheet data are utilized to determine the unmarried status for partnership. If the marital status of a partnered couple cannot be determined, then REMSTATH is set to unknown unmarried status(=9).

The marital status codes follow the same categories as the Core Interview measure RwmSTATH: married, married (spouse absent), separated, divorced, widowed, and never married, and separated/divorced. Separated/divorced is a combined single code used only in Wave 3. However, separated categories for divorced and separated are used in all other waves. REMSTATH codes married and spouse absent as one category, rather than separating spouse in institution vs. not in institution.

From Wave 7 forward, some cases report a marital status of annulled which is treated as "never married".

### **Core and Exit Differences**

The Core interview measure RwmSTATH uses questions asked of the Respondent as well as questions asked of the spouse and/or partner. The Exit Interview marital status without partnership is constructed using only the proxy's response for the Respondent. For Exit Interview Wave 2H and 3 cover sheet data, preload and previous interview marital codes for unmarrieds are utilized, and all other Exit Interview Waves, unmarried marital status and cover sheet data are used to determine the unmarried status for partnership.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

The asking and coding of marital status differs from wave to wave. In Waves 1 and 2H Respondents are specifically asked their marital status as married, partnered, separated, divorced, widowed or never married. The marital status in the public use data also includes a "Married, spouse absent" status that is split between those whose spouse is in a nursing home and those whose spouse is not institutionalized. In Wave 2A, a single item is used to assess marital status. Response categories include married (spouse present), married (spouse absent), living with someone, separated/divorced, widowed, and never married. The separated and divorced categories are not coded separately.

In Wave 3H, the Respondent is not asked marital status; it is derived from preloaded marital status and a series of questions in the cover sheet section. There is a "corrected" marital status included in the Wave 3H public use data. In addition, the separated and divorced statuses are not coded separately. In Waves 1, 2, and 3H, partnership overrides any other marital status. Marital status in Wave 3A is also derived using questions from the cover sheet section. The separated and divorced statuses are in a single category, and partnership overrides any other marital status.

Beginning in Wave 4, all partnered and unmarried single Respondents are asked marital status. Through Wave 6, the status must be an unmarried status, treating separated as an unmarried category apart from divorced. Beginning in Wave 7, married or annulled may be coded, in addition to the unmarried statuses.

Marital status in the raw data is set to married or separated for Respondents determined to have these statuses from the cover sheet section questions. There is no distinction made between spouse present and spouse absent in the raw marital status variable, but this information is available from other questions in the cover sheet section.

The cover sheet section sequence of questions that lead to a marital status and determination of "coupleness," are included in the data starting in Wave 3. These questions are examined to help set the cleaned marital status used to derive RwmSTAT.

Respondents who have an unmarried to married transition between interviews, or vice versa, are asked about marriages and ends of marriages (divorce or widowhood) that may have occurred between interviews at all waves after the initial interview in which a Respondent appears.

From Wave 4 forward, some partners appear to have married based on these reported marital transitions. These cases often report "other" in response to the question about specific unmarried status; note that "married" is not allowed in response to this question. Cases with both a reported marital event and a report of "other" marital status are set to married in the cleaned versions of marital status used in deriving RwmSTAT.

Marriage history is asked of individuals at the first interview to which they respond. The questions generally proceed from current marital status and ask number of marriages, the date the first and most recent marriage began, and either the length or end date of those marriages. For previous marriages, questions ask how it ended. In Wave 1, partnered Respondents are asked the timing of their most recent marriage, but not how it ended. For Wave 2A, partnered Respondents who report being previously married are asked how the marriage ended, and the number of years they were married. For new Respondents in Wave 2H the most recent marriage is only asked about if it is also the first. From Wave 3 forward, new Respondents are asked how the most recent marriage ended if they were ever married.

## **Exit Interview Variables**

In Wave 2H, the Proxy is asked about the Respondent's marital status as married, partnered, separated, divorced, widowed, or never married. The marital status includes a married (spouse absent) status that is split between those whose spouse is in a nursing home and those whose spouse is not institutionalized. These are combined into one category which is married, spouse absent.

In Wave 3H, the Respondent is not asked marital status; it is derived from the preloaded marital status and questions from the cover sheet section. The separated and divorced statuses are coded as a single category. Marital status in Wave 3A is also derived using questions from the cover sheet section, and there is a distinction for married spouse present and married spouse absent. In Waves 2H and 3, unmarried codes for partners are determined by cover sheet, preload and previous interview data.

From Wave 4 forward, all partnered and unmarried single Respondents are asked marital status. Through Wave 6, the status must be an unmarried status, treating separated as an unmarried category apart from divorced. Beginning in Wave 7, married or annulled may be coded, in addition to the unmarried statuses. Marital status in the raw data is set to married or separated for Respondents utilizing cover sheet section questions. There is no distinction made between spouse present and spouse absent in the raw marital status variable, but this information is available from other questions in the cover sheet section.

From Wave 7 forward some cases report a marital status as annulled, which is treated as never married.

## How Constructed

RwMRCT reports the number of times a Respondent has been married. It is pulled from the marriage history information and assigned at the first wave the Respondent enters the HRS. The marriage history information provides number of marriages, including the current one. After the first wave, the number of marriages changes if the Respondent reports a marriage beginning between waves or if a change in marital status indicates that one has begun. Additionally, if the Respondent is married in 2 consecutive waves but to different spouses, a marriage is added for the new spouse.

Please note that the maximum number of marriages an individual can report at the first interview varies. If the first interview is Wave 1, there is no maximum; at most, 15 marriages are reported. In Wave 2H the maximum is 15. For all other waves the maximum allowed is 4.

RwMNEV indicates if the Respondent has never been married. If the Respondent reports having an ever-married status but later reports being never-married, they remain ever-married, i.e.,  $RwMNEV=0$  for the later wave. From Wave 7 and forward, some cases report marital status as annulled, which is treated as never married.

For ever-married Respondents, three additional variables are derived:  $RwMDIV$  counts the number of divorces the Respondent has reported;  $RwMWID$  counts the number of times the Respondent reports being widowed; and  $RwMEND$  counts the number of ended marriages where the ending status (divorce or widowhood) is unknown.

The derivation for number of times marriages end for each of these three variables begins with the individual's marriage history at the first interview to which they respond. The number of divorces and widowhoods are counted as well as the number of remaining marriages that ended for which the end status is unknown. At subsequent interviews,  $RwMDIV$  and  $RwMWID$  counts are increased if a Respondent's marital status changes from married or separated to divorced or widowed, respectively. Similarly,  $RwMDIV$ ,  $RwMWID$ , and  $RwMEND$  counts are increased, respectively, if a divorce, widowhood, or any marriage end with an unknown status is reported as occurring between interviews.

Spouse marital and mortality statuses are used to help fill missing or ambiguous marriage ends. Partners living together are treated as having an unmarried or separated status.

The spouse's variables are taken from the Wave "w" spouse's variables, i.e., from the Wave "w" spouse's RwmRCT, RwmNEV, RwmDIV, RwmWID, and RwmMEND. These spouse variables are set to .U if the Respondent is unmarried or unpartnered and are set to .V if the Respondent's spouse or partner did not respond in a given wave.

## Cross Wave Differences in Original HRS Data

Marriage history is asked of individuals at the first interview to which they respond. The questions generally proceed from current marital status and ask number of marriages, the date the first and most recent marriage began, and either the length or end date of those marriages.

From Wave 2H forward for the HRS sample and for the AHEAD sample from Wave 3A forward, a change from unmarried to married status or vice versa since the last interview triggers questions about whether a marriage has begun or ended since the last interview. If any marital events between interviews are reported, the month and year of each is collected.

The asking and coding of marital status differs from wave to wave. In Waves 1 and 2H, Respondents are specifically asked their marital status as married, partnered, separated, divorced, widowed or never married. The marital status in the public use data also includes a "Married, spouse absent" status that is split between those whose spouse is in a nursing home, and those whose spouse is not institutionalized. In Wave 2A, a single item is used to assess marital status. Response categories include married (spouse present), married (spouse absent), living with someone, separated/divorced, widowed, and never married. The separated and divorced categories are not coded separately.

In Wave 3H, the Respondent is not asked marital status; it is derived from preloaded marital status and a series of questions in the cover sheet section. There is a "corrected" marital status included in the Wave 3H public use data. In addition, the separated and divorced statuses are not coded separately. In Waves 1, 2, and 3H, partnership overrides any other marital status. Marital status in Wave 3A is also derived using questions from the cover sheet section. The separated and divorced statuses are in a single category, and partnership overrides any other marital status.

Beginning in Wave 4, all partnered and unmarried single Respondents are asked marital status. Through Wave 6, the status must be an unmarried status, treating separated as an unmarried category apart from divorced. Beginning in Wave 7, married or annulled may be coded in addition to the unmarried statuses. Marital status in the raw data is set to married or separated for Respondents determined to have these statuses from cover sheet section questions.

The cover sheet section sequence of questions that lead to a marital status and determination of "coupleness," are included in the data starting in Wave 3. These questions are examined to help set the cleaned marital status.

Respondents who have an unmarried to married transition between interviews, or vice versa, are asked about marriages and ends of marriages (divorce or widowhood) that may have occurred between interviews at all waves after the initial interview in which a Respondent appears.

Marriage history is asked of individuals at the first interview to which they respond. The questions generally proceed from current marital status and ask the number of marriages, the date the first and most recent marriage began, and either the length or end date of those marriages. For previous marriages, questions ask how it ended.

The skip pattern and amount of marital history information gathered varies from wave to wave. In Wave 1, data are collected on 3 past marriages, and the current or most recent marriage. For new Respondents in Wave 2H, data are collected only about the first marriage. For new Respondents in Wave 3H, data are collected on the first and most recent marriages. In Waves 4 and 5, new Respondents are asked about 3 past marriages and the current marriage. In Wave 6, new Respondents are asked about 3 past marriages. In Wave 6, an apparent skip pattern problem occurred so that the current marriage data are not collected for new Respondents who are married. This was corrected in Wave 7.

In Wave 1, partnered Respondents are asked the timing of their most recent marriage, but not how it ended. For other unmarried Respondents, the current marital status reveals how the most recent marriage ended. The ending status of up to 3 past marriages is asked. There is no maximum for the number of marriages the Respondent can report, though no more than 15 marriages are reported. If the Respondent reports more than 4 marriages, the specific ending status of additional marriages is unknown.

Except for overlap cases, the first interview for AHEAD sample members is Wave 2A. Here Respondents can report a maximum of 4 marriages (meaning 4 or more), and are asked about their current, or most recent marriage (if currently living with someone). There are some issues with the questions in this section. First, the "year married" question, which follows the marital status question, presumably is referring to the Respondent's current spouse. However, at least a couple of people may have misunderstood the question. When we compared the marriage beginning dates reported by overlap cases in HRS W1 and AHEAD W1, we found that four people, all of whom had multiple marriages, gave dates that corresponded to previous marriages. Second, Respondents who report "living with someone" are then asked if they have ever been married, and if so, what year that marriage ended. The problem with this sequence of questions is that a person can be married more than one time, in which case we assume that they are reporting on the most recent marriage.

For new Respondents in Wave 2H, the Respondent can report a maximum of 15 marriages. Current marital status reveals the way the most recent marriage ended. Marital history asks only how the first marriage ended, if the Respondent has more than one marriage. If the Respondent reports more than 2 marriages, the way the additional marriages ended is unknown.

For Waves 3A and 3H, new Respondents can report being married a maximum of 4 times. They are asked how the first and most recent marriages ended, if ever married. If the Respondent reports more than 2 marriages, the way the additional marriages ended is unknown.

From Wave 4 forward, new Respondents can report being married a maximum of 4 times. They are asked how the first three, and most recent, marriages ended, if ever married, for a total of up to 4 marriage end statuses. In Wave 6, because of a question skip problem, the fourth marriage information was not collected. The way the most recent marriage ended can be taken from current marital status.

## How Constructed

RwMCURLN-length of the current marriage in years, RwMLEN-the length of the longest marriage up through Wave "w," and RwMLENM-number of marriage lengths which are unknown are assigned by looking at marital history dates, marital events, and marriage status.

At the first interview, the date the most recent marriage began is asked. This date is kept across interviews until the marriage ends in divorce or widowhood. If the Respondent begins a new marriage, the current marriage begin date is reset to reflect this. Data are not collected on all marriages: up to four previous marriages if the Respondent enters the HRS in Waves 1, 4, 5, or 7 forward; up to three previous marriages if the Respondent enters the study in Wave 6; or up to two previous marriages if the Respondent enters in Waves 2H or 3. If the first interview is Wave 2A, there is information on at most one previous marriage. If the Respondent gives a marriage date or length that indicates being married before age 12, the dates or length are treated as missing, depending on what information is provided.

The spouse's information is examined, if available, to fill missing current marriage begin dates if they are missing from the retrospective marriage history at a Respondent's first interview. This step is introduced to address the skip pattern problem in Wave 6, where no current marriage begin dates were collected for married new interviewees. The problem was corrected in Wave 7.

Missing dates in the marriage history data are abundant. For marital events between interviews, there is about a 2 year range when they can occur. If dates are missing for between interview events, they are estimated based on interview and other marriage dates so as to compare lengths of marriages.

If the Respondent is married (or separated) at the interview, the length of the current marriage is calculated as the time from the marriage begin date to the interview end date. Separations are treated as continuing marriages. If the Respondent is unmarried, RwMCURLN is missing.

The spouse's variables are taken from the Wave "w" spouse's variables, i.e., from the Wave "w" spouse's RwMCURLN, RwMLEN, and RwMLENM. These spouse variables are set to .U if the Respondent is unmarried or unpartnered and are set to .V if the Respondent's spouse or partner did not respond in a given wave.

## Cross Wave Differences in Original HRS Data

The asking and coding of marital status differs from wave to wave. In Waves 1 and 2H, Respondents are specifically asked their marital status as married, partnered, separated, divorced, widowed or never married. The marital status in the public use data also includes a "Married, spouse absent" status that is split between those whose spouse is in a nursing home, and those whose spouse is not institutionalized. In Wave 2A, a single item is used to assess marital status. Response categories include married (spouse present), married (spouse absent), living with someone, separated/divorced, widowed, and never married. The separated and divorced categories are not coded separately.

In Wave 3H, the Respondent is not asked marital status; it is derived from preloaded marital status and a series of questions in the cover sheet section. There is a "corrected" marital status included in the Wave 3H public use data. In addition, the separated and divorced statuses are not coded separately. In Waves 1, 2, and 3H, partnership overrides any other marital status. Marital status in Wave 3A is also derived using questions from the cover sheet section. The separated and divorced statuses are in a single category, and

partnership overrides any other marital status.

Beginning in Wave 4, all partnered and unmarried single Respondents are asked marital status. Through Wave 6, the status must be an unmarried status, treating separated as an unmarried category apart from divorced. Beginning in Wave 7, married or annulled may be coded, in addition to the unmarried statuses. Marital status in the raw data is set to married or separated for Respondents determined to have these statuses from cover sheet section questions.

The cover sheet section sequence of questions that lead to a marital status and determination of "coupleness," are included in the data starting in Wave 3. These questions are examined to help set the cleaned marital status. Included in the cover sheet questions are dates for when a spouse died or separated, and when the Respondent started living with a new spouse or partner.

Respondents who have an unmarried to married transition between interviews, or vice versa, are asked about marriages and ends of marriages (divorce or widowhood) that may have occurred between interviews at all waves after the initial interview in which a Respondent appears. If a marriage, divorce, or widowhood is reported, the month and year of the event is asked.

Marriage history is asked of individuals at the first interview to which they respond. The questions generally proceed from current marital status and ask the number of marriages, the date the first and most recent marriage began, and either the length or end date of those marriages. For previous marriages, questions ask how it ended.

The skip pattern and amount of marital history information gathered varies from wave to wave. In Wave 1, data are collected on three past marriages, and the current or most recent marriage. For new Respondents in Wave 2H, data are collected only about the first marriage. For new Respondents in Wave 3H, data are collected on the first and most recent marriages. In Waves 4 and 5, new Respondents are asked about three past marriages and the current marriage. In Wave 6, new Respondents are asked about three past marriages. In Wave 6, an apparent skip pattern problem occurred so that the current marriage data were not collected for new Respondents who were married. This was corrected in Wave 7 so that information on the current and three past marriages is collected.

In Wave 1, there is no maximum for the number of marriages the Respondent can report. If the Respondent reports more than four marriages, then all information about at least some marriages will be completely missing. The beginning and end month of the current or most recent marriage are asked. For past marriages, only the year is obtained.

Except for overlap cases, the first interview for AHEAD sample members is Wave 2A. Here Respondents can report a maximum of four marriages (meaning four or more), and are asked for details about only their current, or most recent marriage (if currently living with someone). There are some issues with the questions in this section. First, the "year married" question, which follows the marital status question, presumably is referring to the Respondent's current spouse. However, at least a couple of people may have misunderstood the question. When we compared the marriage beginning dates reported by overlap cases in HRS W1 and AHEAD W1, we found that four people, all of whom had multiple marriages, gave dates that corresponded to previous marriages. Second, Respondents who report "living with someone" are then asked if they have ever been married, and if so, what year that marriage ended. The problem with this sequence of questions is that a person can be married more than one time, in which case we assume that they are reporting on the most recent marriage. For those not married, then the year the marriage ended and the length of the marriage are ascertained.

For new Respondents in Wave 2H, the Respondent can report a maximum of 15 marriages. The begin and end year of the first marriage is asked if the Respondent reports more than one marriage. If the Respondent only reports one marriage, the begin month and, if applicable, end month of the most recent marriage are only asked if the event occurred between interviews. If the Respondent reports more than two marriages, the information about any except the first, and perhaps the most recent, marriage will be completely missing.

For Waves 3A and 3H, new Respondents can report being married a maximum of four times. They are asked the year when the first and most recent marriages began. If a begin year is after 1992, the month of marriage is also asked. If the marriage ended, the Respondent is asked how many years it lasted. If the Respondent reports more than two marriages, the information about any besides the first and most recent is completely missing.

From Wave 4 forward, new Respondents can report a maximum of four marriages. They are asked the month and year the first three and most recent marriages began and how many years each marriage lasted. In these waves there can be information about up to four marriages, which is the maximum number of marriages that can be reported, so all known marriages are inquired about. In Wave 6, because of a question skip pattern problem, the fourth marriage information was not collected. The month and year that the current

marriage began is missing for all new interviewees who were newly married. The month and year of the fourth marriage is missing for those with four marriages.

## How Constructed

This variable is assigned by looking at all waves of data for the first non-missing values. The Wave 1 and 2H values are recoded to 5 categories in order to be compatible with the codes from Wave 3H forward, and for the AHEAD sample, from Wave 2A forward. The broader categories used for Waves 1 and 2H are: Protestant (including 'non-traditional Christian'), Catholic, Jewish, none or no preference, and other.

From Wave 3H forward, the HRS variable is simply recoded for missing values. The same is true for Wave 2A forward.

The spouse variable SwRELIG is taken from the Wave "w" spouse's self-reported data, i.e., from the spouse's RARELIG variable.

## Cross Wave Differences in Original HRS Data

In Wave 1 the questions on religious preference are asked as follows:

"What is your religious preference: Protestant, Roman Catholic, Jewish, or something else?"

"What denomination is that?"

From Wave 2 forward, the wording of the first question is slightly different:

"What is your religious preference; is it Protestant, Catholic, Jewish, some other religion, or do you have no preference?"

In Waves 1 and 2H, the resulting variable codes only the "denomination," but the codebook lists them in broader groupings: Protestant, Catholic, Jewish, non-traditional Christian (e.g., Quakers, Latter Day Saints), non-Judeo-Christian (e.g., Hindu, Islam), no religion, and other (e.g., Jewish and Catholic, or Catholic summers / Lutheran winters).

From Wave 3H forward, and for the AHEAD sample, from Wave 2A forward, the resulting variable appears to be based on the first question with only 5 codes: Protestant, Catholic, Jewish, No Preference, and Other.

1.Yes		2568	2173	2014	1605	1430

## How Constructed

This variable is assigned by looking at all waves of data for the first non-missing values. The first non-missing value for veteran status is used. It is coded as "1" for yes, served in the military, and "0" for no.

The spouse variable SwVETRN is taken from the Wave "w" spouse's self-reported veteran status, i.e., from the Wave "w" spouse's RAVETRN.

## Cross Wave Differences in Original HRS Data

The question about military service is only asked at the Respondent's first interview.

In Waves 1 and 2H the question wording is:

"Have you ever been in the active military service?"

From Wave 3H forward, and from Wave 2A of the AHEAD sample forward, the question wording is:

"Have you ever served in the active military of the United States?"

2.Trk=not US/RABPLACE=US  
3.Trk=miss/RABPLACE=Valid Census Division

## How Constructed

RABPLACE indicates the Respondent's birthplace. It is assigned by looking at all waves of data for the first non-missing value. Place of birth is reported as Census Division; a code of 11 indicates not in the US, including foreign countries and U.S. territories. A code of 10 indicates in the US, but without the Census Division information.

In Wave 2A of AHEAD, the Census Division is not available; only whether the Respondent was born in the US or not. This is used to set the birthplace to code 10 or 11.

The HRS Region file also provides the Census Division of birthplace in the variable REGIONB. If RABPLACE is missing or 10, and a more specific Census Division is available from this source, we use it to fill RABPLACE.

There are some cases where REGIONB is 05, a valid Census Division, but the core data indicate that the Respondent is foreign-born (RABPLACE=11). For these cases we leave RABPLACE as coded in the core data, i.e., as foreign-born. Note that a code of 5 typically means "No" in the HRS.

We compare RABPLACE to the USBORN variable on the Tracker file and code the results in RABPLACF. There are cases where USBORN indicates that the Respondent was born in the U.S., but the birth place given in the core data and Region file is coded foreign-born. There are also cases where USBORN indicates that the Respondent was born outside the U.S., but the core and Region file indicate a U.S. Census Division. In these cases we use the birth place coded in the core data, but indicate the discrepancy in RABPLACF.

The spouse's variable SwBPLACE is taken from the Wave "w" spouse's self-reported birthplace, i.e., from the Wave "w" spouse's RABPLACE.

## Cross Wave Differences in Original HRS Data

The first time a Respondent is interviewed, the HRS survey asks where they were born. Those born in the U.S. are asked which state, and those born outside the U.S. are asked which country.

In the public use data files, there is one variable which codes whether the Respondent is U.S.-born, and another in which the state or country of birth is masked; that is, recoded to one variable indicating the Census Region of birth, with a code for non-U.S. birthplaces.

In Wave 2A of AHEAD, only the first variable, whether the Respondent is U.S.-born, is available. In all other waves, the Census Region is also available.

There is also a variable available from the HRS Region file (REGIONB). Additionally, the Tracker file also carries a variable based on whether the Respondent reports being born in the U.S. (USBORN).

## How Constructed

RwMOMAGE and RwDADAGE are assigned respectively to the Respondent's mother's and the Respondent's father's current age if living or age at death if deceased. RwMOMLIV and RwDADLIV flag whether a Respondent's mother and father, respectively, are still alive. RwLIVPAR counts a Respondent's own living parents. It is derived by summing the RwMOMLIV and RwDADLIV variables. If either RwMOMLIV or RwDADLIV is missing, then RwLIVPAR is missing.

SwMOMAGE, SwDADAGE, SwMOMLIV, SwDADLIV, and SwLIVPAR are the analogous variables for the parents of the Respondent's spouse. If the Respondent is unmarried, they are assigned .U missing values. In waves where the spouse did not provide an interview and the Respondent only reports on their own parents, the spouse variables are assigned .V missing values.

For Waves 1 and 2H, the derivations use preprocessed variables that assign parent and in-law information to Respondents. In

Waves 3H, 4, and 5, the derivations use household-level data, taking into account whether the Respondent is the Family Respondent or not. If the Respondent is the Family Respondent, then parent data are assigned to the Respondent's parent variables and parent-in-law data are assigned to the spouse's parent variables. If the Respondent is not the Family Respondent, then parent-in-law data are assigned to the Respondent's parent variables and parent data are assigned to the Respondent's parent-in-law variables. In Waves 2A and 3A and from Wave 6 forward, parent data are collected from Respondents about their own parents. Information about parents-in-law is assigned from the spouse's report on their own parents.

If a parent is reported deceased at an interview and the parent data are missing at a subsequent interview, the data are carried forward. If the parent data are given at an interview but missing at a prior interview, the data are carried back. When carrying data forward or back for in-laws, the spouse IDs are compared to ensure that the information is for the same spouse.

## Cross Wave Differences in Original HRS Data

Information about parent mortality and age is reported in the Family Section at each interview. In Waves 1, 2H, 3H, 4, and 5, the designated Family Respondent answers all questions about parents and parents-in-law in a couple household. In Waves 2A and 3A, and from Wave 6 forward, each Respondent answers the questions about their own parents.

In Waves 1 and 2H, the raw HRS data provides parent data in separate sections with observations by parent. In Wave 2H there may be multiple observations per parent. The data may include information on up to 4 parents per household with the Family Respondent's parents and in-laws. In Waves 2A and 3A, and from Wave 6 forward, the raw data provide parent data in Respondent level variables with one observation per Respondent. In Waves 3H, 4 and 5 the raw HRS data provide parent data in household level variables with one observation per household holding information on up to four parents.

Preprocessing of Wave 1 and 2H data collapses the parent-level observations to each Respondent as a set of 4 variables for each measure pertaining to the Respondent's mother, father, mother-in-law, and father-in-law. The process takes into account whether the Respondent is the Family Respondent or not. For Waves 2A and 3A, and from Wave 6 forward, each Respondent provides information about their own mother and father, regardless of who the Family Respondent is. Information about parents-in-law is based on the spouse's responses. In Waves 3H, 4, and 5 the assignment of parent data is adjusted to account for the Respondent's Family Respondent status.

Concerning RwmOMAGE and RwdADAGE if a parent is living, a question asks how old the parent is. If the parent is deceased a question asks how old the parent was when they died. In Waves 1 and 2H the question wordings are: "How old is she/he?" and "How old was he/she when he/she died?" In Waves 2A and 3H, and from Wave 4 forward, the wording is slightly different: "About how old is she/he?" and "About how old was he/she when he/she died?" These questions are skipped if preloaded information indicates that the Respondent reported the parent deceased at a previous interview.

Unlike other waves, Respondents in Wave 2A who either don't recall, or refuse to answer the question about their parents' age at death, enter into a sequence of two "bracket" questions ("Was he/she older than 65?"; and "Was he/she older than 85?") The pattern of responses to these questions is captured in four special missing codes (.E = died before 65; .F = died between 65-85; and .G = died after 65+; and .H = died after age 85+).

Concerning RwmOMLIV, RwdADLIV, and RwlIVPAR in Wave 1, a question asks: "Is [your, your spouse/partner's] [mother, father] living now?" At subsequent interviews the question is: "Is [your, your spouse/partner's] [mother, father] still living?" This question is skipped if preloaded information indicates that the Respondent reported that the parent had died at a previous interview.

From Wave 7 forward, the answer is set to "Yes" without asking the question if the parent is a resident in the Respondent's household.

## How Constructed

RwSHLT is the Respondent's self-reported general health status. Codes range from "1" for Excellent to "5" for Poor. SwSHLT is the Respondent's spouse or partner's self-reported general health status.

RwSHLT is assigned the value of the raw variable except where the missing values for don't know, refused, and other missings are recoded to .D, .R, and .M, respectively.

RwSHLT and SwSHLT are used in the construction of a change in health variable RwSHLTC. Please see "Change in Health" for a description of these measures.

The SwSHLT variables are taken from the Wave "w" spouse's self-reported RwSHLT variables.

## Cross Wave Differences in Original HRS Data

In Wave 1 values for self-reported health status are imputed by HRS if missing. These imputations are used. From Wave 2 forward, values are not imputed by HRS.

## How Constructed

RwHLTC3 is a 3-category variable indicating the Respondent's self-reported change in health. The Respondent can report their health is "better," "about the same," or "worse" since the last interview or in the last two years.

RwHLTC5 is a 5-category variable indicating the Respondent's self-reported change in health since the last interview or in the last two years. For Waves 1-6, the questionnaires provided 5 options for the self-reported change in health: "much better," somewhat better, "about the same," "somewhat worse," and "much worse."

In Waves 1 and 2 RwHLTC5 is derived directly from the raw variables, with missing values recoded. For Waves 3-6, the question is asked in two parts, one for whether the Respondent's health is better or worse, and a follow-up question revealing how much better or worse. The derivation combines the lead-in and follow-up questions to arrive at the same 5-point scale used in the single Wave 1 and 2 questions. A few cases are missing values for one of the questions. If the follow-up question is not missing, its answer is used. If the lead-in question is answered but the follow-up is missing, "somewhat" was assumed, and these cases are flagged in the RwHLTC5F variables. Most cases that answer both questions give "somewhat" as the follow-up answer.

SwHLTC3 and SwHLTC5 variables give the spouse's self-reported change in health corresponding to RwHLTC3 and RwHLTC5, respectively. SwHLTC5F is the spouse variable flagging an imputed "somewhat" response when the follow-up question is missing.

Please see also the calculated change in self-reported health variable (RwSHLTC) described later in this section. Note that RwHLTC3 and RwHLTC5 ask the Respondent to assess retrospectively how their health has changed since the last interview while RwSHLTC compares measures of self-reported current health from the two time points.

### Cross Wave Differences in Original HRS Data

In Wave 1, everyone is asked to describe their health compared to 1 year ago using 5 options: "much better," "somewhat better," "same," "somewhat worse," or "much worse." Wave 2A asks everyone to describe their health as compared to 1 year ago using 3 options: "better," "same," or "worse."

In Wave 2H, new Respondents are asked to compare their health to 2 years ago while re-interview Respondents are asked to rate their health compared to their previous interview using the 5 options described above.

In Wave 3A, all Respondents are asked to rate their health as "better," "about same," or "worse." If they responded with either "better" or "worse," then they are asked a follow-up question to clarify whether their health is "much [better/worse]" or "somewhat [better/worse]." New Respondents are asked to compare their health in the last 2 years. Re-interview Respondents are asked what happened to their health since their last interview.

From 3H forward, only re-interview Respondents are asked to compare their health to their previous interview. From Waves 3H to Wave 6, the sequence of questions is the same as that in Wave 3A. From Wave 7 forward, the second set of questions has been dropped, and re-interview Respondents are asked only if their health is "better," "about the same," or "worse" since the last interview.

## How Constructed

### Core Interview Variables

RwHOSP indicates whether the Respondent reports any overnight hospital stay in the reference period. In Wave 1 and 2A, the reference period is 12 months; in other waves it is the period since the last interview, or the last 2 years for new interviewees. If the Respondent reports any overnight hospital stay, RwhSPTIM is the reported number of stays and RwhSPNIT is the reported number of nights over all stays. If the previous interview was more than two years ago, it is possible for RwhSPNIT to exceed 730 (365 x 2 years, 365 x 4 years, etc.). These high values can be checked against the INW variables, which indicate whether the Respondent was present for the wave in question. Values of 996 are also reported and confirmed by HRS.

SwHOSP, SwHSPTIM, and SwHSPNIT give this information for the Respondent's spouse or partner.

Medical care utilization variables are recoded for missing values. In Wave 1, the medical utilization variables are imputed in the original HRS data. Imputed values are recoded to missing. RwHOSP is recoded as a yes/no indicator. If the Respondent did not report any hospital stay, then RwhSPTIM and RwhSPNIT are set to zero.

In Wave 2A, questions about hospital utilization were asked of the Financial Respondent (for both in a couple.) In addition, the question about any overnight hospital stay was asked of all individual Respondents. When both levels of information are available,

the Financial Respondent's HH-level information may not agree with the information given by individual Respondents in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible, we use HH level data to fill missing spouse/partners' information.

In Wave 2A, the S2HOSP is taken from spouses' or HH-level response. For all other waves, the spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3HOSP is taken from the Wave 3 spouse's R3HOSP variable.

### **Exit Interview Variables**

REHOSP indicates whether the Respondent had died in a hospital or had any overnight hospital stays between the last Core Interview and death.

REHSPTIM is the reported number of stays in a hospital between the last Core Interview and death. If the proxy indicates the Respondent had an overnight hospital stay at or before death, died in the hospital, or had an overnight hospital stay between the last Core Interview and death (i.e., REHOSP="1.Yes"), and the number of stays in a hospital (REHSPNIT) is zero or missing, we assign REHSPTIM a value of "1," indicating one stay in a hospital.

REHSPNIT is the total number of nights spent in the hospital over all stays between the previous interview and death. When REHOSP indicates hospital utilization, we use one of two methods to calculate REHSPNIT. If the proxy gives dates of hospital stays that begin after the Respondent's last Core Interview, we use the dates provided by the proxy; however, if the proxy gives an event of hospital utilization that begins before the last Core Interview date, we calculate REHSPNIT beginning with the last Core Interview date and ending with the death date. If the proxy does not report that the Respondent had any hospital stay, then both REHSPTIM and REHSPNIT are set to zero.

Please note that it is not uncommon for the last Core Interview to be more than two years before the Exit interview, allowing for REHSPNIT to be greater than 730 nights. REHSPNIT can also indicate a fraction of a day, as in some cases, the amount of time spent in a hospital can be as little as an hour or ".042" of a day.

### **Core and Exit Differences**

Core and Exit Interviews use different reference periods. The Core Interview uses the current and previous interview dates as the endpoints, whereas the Exit Interview uses the last Core Interview date and the death date.

From Exit Interview Wave 3 forward, there are two possible sets of questions to generate derived variables related to hospital utilization; time spent in a hospital before death; and the total number of nights spent in a hospital between the last Core Interview and death. The Core Interview has only one question.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

The questions about medical service utilization vary across waves. Waves 1 and 2A questions ask about the last 12 months, while questions in subsequent waves ask about the period since the previous interview or the last 2 years.

In Wave 1, questions ask about hospital and nursing home stays, doctor visits, and home health care. In Wave 2H, questions are added that ask about prescription drugs. In Wave 2A and from Wave 3 forward, questions are added that ask about outpatient surgery, dentist, and special facilities or services.

In Wave 2A, the Financial Respondent was asked the medical utilization and expenditure questions, which differs from all other waves. Questions asked only of the Financial Respondent yield HH-level data, and those asked of all Respondents yield Respondent-level data. Note that when both levels are available the Financial Respondent's HH-level information may not agree with the information given by individual Respondents in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible for utilization variables, we use HH level data to fill missing spouse/partners' information.

For hospital stays, the questions ask if the Respondent was a patient overnight, how many times, and how many nights altogether. In Wave 2A and from Wave 3 on, the question wording refers to "how many different times," instead of "how many times."

### Exit Interview Variables

From Wave 3H forward, if the Respondent died in the hospital, the proxy is asked a separate question about the duration of the final hospital stay in addition to the question about the duration of all hospital stays after the last Core Interview and death.

From Wave 7 forward, the number of stays in a hospital can include stays in mental hospitals and sanitariums.

## How Constructed

### Core Interview Variables

RwNRSHOM indicates whether the Respondent reports any overnight nursing home stay in the reference period. In Waves 1 and 2A, the reference period is 12 months, in other waves it is the period since the last interview, or the last 2 years for new interviewees. If the Respondent reports any overnight nursing home stay, RwNRSTIM is the reported number of stays, and RwNRSNIT is the reported number of nights over all stays.

From Wave 3 forward, a set of related variables provides information about nursing home residence when the Respondent is living in a nursing home at the time of the interview. RwnHMLIV indicates whether the Respondent lives in a nursing home or other health care facility at the time of the interview. For those living in a nursing home, RwnHMMVY and RwnHMMVM give the year and month of moving into the facility. RwnHMDAY is the calculated number days since the last interview that the Respondent has been living in a nursing home. If the move-in date is after the previous interview then RwnHMDAY is assigned the number of days between the 15th of the move-in month and the 15th of the current interview month. If the move-in date is earlier than the previous interview then RwnHMDAY is assigned the number of days between interviews.

Beginning with Tracker 2004 V1, HRS implemented a verified nursing home residence flag for each wave (xNURSHM). From Wave 5 forward, there are cases at each interview where this information conflicts with nursing home residency reported in the core data cover sheet section. This is especially true from Wave 13 forward, where the Tracker nursing home residence flag contains a new value of "2" (Interviewed in community this wave [yes to xA028 AND residence confirmed as other than nursing home]). We incorporate the verified nursing home information from Tracker with nursing home utilization information. The question about any nursing home stay is filled by default as "Yes" for those living in a nursing home; in some cases the interviewer seems to have over-ridden this with a "No," but in others this did not occur. We examine these cases for length of stay, residency move-in date, and missing answers to estimate whether there is any nursing home utilization besides the residency reported in the core data, which HRS has determined is NOT a nursing home. If the length of stay is reported as zero nights, continuous since move-in (996), or is about the same as the length of residency as determined from move-in dates, then we assume that the stay is the same as the residence which is not a nursing home, i.e., that there is no nursing home utilization. If the answers to the number of times or number of nights are missing, we assume these indicate the realization that the current residence is not a nursing home, without knowing how to undo the default assumption of a nursing home stay, so in this case we also assume no nursing home utilization. If the number of stays is given as 5, we assume this was intended to be the normal code for "No," and assume no nursing home utilization in this situation as well. We also apply the Tracker information to RwnHMLIV, RwnHMMVM, RwnHMMVY, and RwnHMDAY. If Tracker indicates that the Respondent is not a nursing home resident, RwnHMLIV is set to "No" and the rest of the variables are irrelevant.

SwNRSHOM, SwNRSTIM, SwNRSNIT, SwNHMLIV, SwNHMMVY, SwNHMMVM, SwNHMDAY give this information for the Respondent's spouse or partner.

Medical care utilization variables are recoded for missing values. In Wave 1, the medical utilization variables are imputed in the original HRS data. Imputed values are recoded to missing. RwNRSHOM is recoded as a yes/no indicator. From Wave 3 forward, if the Respondent is currently in a nursing home, RwNRSHOM is set to yes. If the Respondent did not report any nursing home stay, then RwNRSTIM and RwNRSNIT are set to zero. Also from Wave 3 forward, the number of nights in a nursing home could be reported as

996, indicating "continuous since entered," if the Respondent is living in a nursing home at the time of the interview. For these cases, RwnHMDAY is assigned to RwnNRSNIT, unless more than one stay is reported and the number of days for the current stay is less than the time since last interview. If more than one stay is reported and RwnHMDAY is less than the entire time since last interview, then RwnNRSNIT is assigned the special missing value .L, as the length of at least one of the prior stays is unknown. If the previous interview was more than two years ago, then it is possible for RwnNRSNIT to exceed 730 (365 x 2 years, 365 x 4 years, etc.). These high values can be checked against the INW variables, which indicate whether the Respondent was present for the Wave in question.

In Wave 2A, the question about any overnight nursing home stay was asked at the household level of Financial Respondents for both the Financial Respondent and spouse, and of all individual Respondents as well. When both levels of information are available the Financial Respondent's HH-level information may not agree with the information given by individual Respondents in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible, we use HH level data to fill missing spouse/partners' information.

In Wave 2A, the S2NRSHOM is taken from spouses' or HH-level response. For all other waves, the spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3NRSHOM is taken from the Wave 3 spouse's R3NRSHOM variable.

### **Exit Interview Variables**

RENRSNIT indicates whether the Respondent had died in a nursing home or had any nursing home stays between the last Core Interview and death. RENRSTIM is the reported number of stays and RENRSNIT is the reported number of nights calculated over all stays between the last Core Interview and death.

RENHMLIV indicates whether the Respondent lived in a nursing home between the last Core Interview and death. If RENHMLIV="1. Yes" (i.e., the Respondent lived in a nursing home until death), RENHMDAY is the number of days lived in the nursing home, between the move-in date or Core Interview and death. RENHMMVM and RENHMMVY are the month and year that the Respondent moved into the nursing home where they lived until death.

RENRSNIT is derived from several nursing home utilization variables. In Wave 2H, one question asks if the Respondent spent a night in a nursing home. In all other waves, several questions can result in RENRSNIT="1.Yes," such as living in a nursing home at death, additional overnight stays in a nursing home, or dying in a nursing home.

RENRSTIM is the reported number of overnight stays in a nursing home between the last Core Interview and death. If the proxy indicates that the Respondent lived in a nursing home until death, had a stay in a nursing home, or died in a nursing home (i.e., RENRSNIT="1.Yes"), and the number of nursing home stays (RENRSNIT) is zero or missing, we assign RENRSTIM a value of "1," indicating one stay in a nursing home.

When RENRSNIT indicates nursing home utilization, we use one of two methods to calculate RENRSNIT. If the proxy gives dates of nursing home stays that begin after the last Core Interview, we use the dates provided by the proxy; however, if the proxy gives dates of nursing home stays that begin before the last Core Interview date, we calculate RENRSNIT beginning with the last Core Interview date and ending with the death date. If there is no nursing home utilization, then RENRSNIT and RENRSTIM are both set to zero.

If the Respondent's recorded death date precedes the dates of a nursing home stay reported by the proxy, a special missing value .A is assigned, indicating a death date inconsistency in the data. If number of nights in a nursing home is reported as 996, indicating "continuous since entered", RENRSNIT is assigned RENHMDAY. If more than one stay is reported and RENHMDAY is less than the entire time since last interview, then RENRSNIT is assigned the special missing value .L, as the length of at least one of the prior stays is unknown. Please note that it is not uncommon for the last Core Interview to be more than two years before the Exit interview, allowing for RENRSNIT to be greater than 730 nights.

### **Core and Exit Differences**

RwnNRSNIT in the Core Interview and RENRSNIT in the Exit interview both indicate a nursing home stay in their respective reference periods. In the Core Waves 1 and 2A, the reference period is 12 months, in other Core waves it is the period since the last interview, or the last 2 years for new interviewees. The Exit interview reference period is between the last Core Interview and death.

From Wave 5 forward, xNURSHM (from the Tracker), is also used to derive the Core Interview nursing home utilization variables. We do not use this variable in deriving Exit interview nursing home utilization variables.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

The questions about medical service utilization vary across waves. Waves 1 and 2A questions ask about the last 12 months, while questions in subsequent waves ask about the period since the previous interview or the last 2 years.

In Wave 1, questions ask about hospital and nursing home stays, doctor visits, and home health care. In Wave 2H, questions are added that ask about prescription drugs. In Wave 2A, and from Wave 3 forward, questions are added that ask about outpatient surgery, dentist, and special facilities or services.

In Wave 2A, the Financial Respondent was asked the medical utilization and expenditure questions, which differs from all other waves. Questions asked only of the Financial Respondent yield HH-level data, and those asked of all Respondents yield Respondent-level data. Note that when both levels are available the Financial Respondent's HH-level information may not agree with the information given by individual Respondents in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible for utilization variables, we use HH level data to fill missing spouse/partners' information.

For nursing home stays, the questions ask if the Respondent was a patient in a nursing home overnight, how many times, and how many nights altogether. In Wave 2A and from Wave 3 on, the initial question text includes convalescent home or other long-term health care facility along with nursing home. From Wave 3 forward, the initial question was skipped if the Respondent is currently living in a nursing home. For these nursing home residents, the second question asks how many times including now, and the third question regarding number of nights can be coded 996=continuous since entered.

The questions about residence in the nursing home at the time of the interview and when the Respondent moved into the nursing home begin in Wave 3. Note that in Waves 1 and 2A there are no Respondents living in a nursing home. In Wave 2H, there are only 8 Respondents who are nursing home residents, and there is no provision in the utilization section for using this information to determine use or length of stay. So we have chosen not to consider this information for so few Respondents.

Beginning with Tracker 2004 V1, HRS implemented a verified nursing home residence flag for each wave, xNURSHM, e.g., GNURSHM for Wave 5 (2000). From Wave 5 forward, there are cases at each interview where this information conflicts with nursing home residency reported in the core data cover sheet section. This is especially true from Wave 13 forward, where the Tracker nursing home residence flag contains a new value of "2" (Interviewed in community this wave [yes to xA028 AND residence confirmed as other than nursing home]). In the questions about nursing home utilization, a cover-sheet reported nursing home resident is assigned as "Yes" for any nursing home stays by default. In some cases where Tracker indicates residence is NOT a nursing home, the interviewer had over-riden this with a "No" for any nursing home stays, but in many cases this did not occur. We examine these cases for length of stay, residency move-in date, and missing answers to estimate whether there is any nursing home utilization besides the residency reported in the core data, which HRS has determined is NOT a nursing home.

### **Exit Interview Variables**

In Wave 3, if the Respondent is living in a nursing home, the above question (patient overnight in nursing home) is skipped. However, the total number of nursing home stays is asked. From Wave 3 forward, we use additional questions to derive RENRSHOM: whether the Respondent lived in a nursing home at the time of death or if the Respondent's place of death was a nursing home (please see REPLDEATH). From Wave 6 forward, the responses for R's place of death include an additional code for Assisted Living Facility/Senior Care Home or/Retirement home, this is also coded as nursinh home.

In Wave 2H, there is one follow up question about the number of months or years the Respondent was in a nursing home, and RENRSNIT is calculated using this one question. The questions in the cover sheet used to derive RENHMDAY, RENHMMVM, RENHMMVY were not asked in Wave 2H. These cases are assigned .Q="Not asked this wave".

.R=RF	4
.Y=No Exit Interview, No De	24500
.Z=No Exit Interview, Death	1394
0.No	12652
1.Yes	3557

### How Constructed

REHPCSTY indicates whether the Respondent reports any hospice care stay at death, or between the last Core Interview and death. If the proxy reports any hospice stay, REHPCSTY is assigned "Yes." If there are no hospice stays then REHPCSTY is assigned "No." When REHPCSTY is "No," then REHCPTIM and REHPCNIT are both set to "0".

REHPCTIM is the reported number of stays in hospice care from the last Core Interview and death, and REHPCNIT is the calculated total number of nights spent in a hospice. Each wave reports the number of different hospice stays, including the final hospice care stay. If the proxy indicates the Respondent had an overnight hospice stay (REHPCSTY=1), and the survey response for number of different times in hospice care is zero or missing, we assign REHCPTIM a value of "1," indicating one stay in hospice care.

REHPCNIT is the number of nights spent in hospice care between the last Core interview and death. This variable is calculated from questions about the number of days, nights, or months spent in a hospice between the last Core Interview and death. If the Respondent's recorded death date precedes the hospice stay start date reported by the proxy, a special missing value .A is assigned, indicating there is a death date inconsistency in the data. If the Respondent lived in a hospice at the end of life and the length of stay is reported as continuous since entered, or the length of stay is the entire time between the last Core interview and death, then REHPCNIT will reflect the length of that final stay.

It is common for the last Core interview to be greater than two years before the Exit interview; allowing for REHPCNIT to be greater than 730 nights.

## Cross Wave Differences in Original HRS Data

There are no questions asked about utilization of hospice care in Wave 2H.

From Wave 3 forward, the Exit interview includes a question about place of death(REPLDEATH). In Waves 4 through 9, the proxy is also asked where Respondent was living at the time of death, and hospice is an included response option.

In creating hospice nights (REHPCNIT) for Waves 3 through 11, the same questions are asked about hospice nights. For Waves 7 through 9, we also use a cover sheet question about move-in dates to construct hospice utilization nights.

From Wave 12 forward, the definition of hospice is extended and additional hospice care questions are asked. If the proxy reports that the Respondent utilized hospice care, the proxy is asked where the hospice care service was received. The response options include: Hospital, Nursing Home, Home, Hospice Facility, Other Health Care Facility (Assisted Living Facility/Rest Home/Retirements Home/Senior Care), or Other.

From Wave 12 forward, the proxy may give hospice stay information for up to five hospice stay events, captured in REHCPTIM. The questions about hospice nights asks "How long (in total) were hospice services in place before [his/her] death?" and is captured in REHPCNIT.

## How Constructed

### Core Interview Variables

RwDOCTOR indicates whether the Respondent reports any doctor visit in the reference period. In Waves 1 and 2A, the reference period is 12 months; in other waves it is the period since the last interview, or the last 2 years for new interviewees. If the Respondent reports any doctor visit, RwDOCTIM is the reported number of visits.

SwDOCTOR and SwDOCTIM give this information for the Respondent's spouse or partner.

Medical care utilization variables are recoded for missing values. In Wave 1, the medical utilization variables are imputed in the original HRS data. Imputed values are recoded to missing. If the Respondent did not report any doctor visit, then RwDOCTIM is zero. RwDOCTOR is recoded as a yes/no indicator based on the number of visits reported.

From Wave 5 forward unfolding bracket questions are introduced for those who don't know or refuse this question. Any response of "about" to these questions assigns the value to RwDOCTIM. For example if the Respondent responds about 20, then 20 is assigned RwDOCTIM. In addition SAS special missing values indicate the resulting bracket:

- .E indicates 1-4 times
- .F indicates 6-19 times
- .G indicates 21-49 times
- .H indicates 51 or more times
- .I indicates at least once
- .B indicates 0-5 times
- .K indicates 1-19 times
- .L indicates 21 or more times

If the Respondent falls into any of these brackets except 0-5 times (.B), then RwDOCTOR is set to yes (=1). If the Respondent says no to seeing a doctor at least once, RwDOCTIM is set to zero and RwDOCTOR is set to no (=0).

In Wave 2A, the S2DOCTOR is taken from spouses' or HH-level response. For all other waves, the spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3DOCTOR is taken from the Wave 3 spouse's R3DOCTOR variable.

### Exit Interview Variables

REDOCTOR is an indicator of whether the Respondent was seen by a doctor between the last Core Interview and death. REDOCTOR is derived from the question "...how many times has Respondent seen or talked to a medical doctor about Respondent's health, including emergency room or clinic visits since last interview or last two years before death?" If the proxy reports that the Respondent had any doctor visits, REDOCTIM is the reported number of visits.

From Exit Wave 6 forward, unfolding bracket questions are introduced for those who don't know or refuse to answer the question about the number of doctor visits. The method of assigning values to REDOCTIM based on unfolding brackets is the same as that used in RwDOCTIM from the Core Interview.

### **Core and Exit Differences**

From Wave 5 forward, the Core Interview includes unfolding bracket questions to estimate intervals for the number of times the Respondent is seen by a doctor in cases where an exact number is unknown. These questions are introduced in the Exit interview in Wave 6.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

The questions about medical service utilization vary across waves. Waves 1 and 2A questions ask about the last 12 months, while questions in subsequent waves ask about the period since the previous interview or the last 2 years.

In Wave 1, questions ask about hospital and nursing home stays, doctor visits, and home health care. In Wave 2H, questions are added that ask about prescription drugs. In Wave 2A, and from Wave 3 forward, questions are added that ask about outpatient surgery, dentist, and special facilities or services.

In Wave 2A, the Financial Respondent was asked the medical utilization and expenditure questions, which differs from all other waves. Questions asked only of the Financial Respondent yield HH-level data, and those asked of all Respondents yield Respondent-level data. Note that when both levels are available the Financial Respondent's HH-level information may not agree with the information given by individual Respondents in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible for utilization variables, we use HH level data to fill missing spouse/partners' information.

For doctor visits, the question asks how many times the Respondent has seen or talked to a medical doctor including emergency room or clinic visits. In Waves 1 and 2, the question text instructs the Respondent not to include overnight hospital or nursing home stays. From Wave 3 forward, the question text only instructs the Respondent not to include any hospital stays.

From Wave 5 forward, there are unfolding bracket questions if the Respondent doesn't know or refuses to answer the question. The amounts in this series of questions are at least once, 5, 20, and 50 times. The order presented is 20, then 5, and at least once if less than 20, or 50 if more than 20. The responses could be less than, more than, or about.

### **Exit Interview Variables**

In Waves 2H through 5, the value of REDOCTIM depends on the proxy answering the question about the number of times the Respondent was seen by a doctor. From Wave 6 on there is a set of unfolding bracket questions to estimate intervals for the number of times the Respondent is seen by a doctor in cases where an exact number is unknown.

In Wave 2H the Exit Interview question is: "[Not counting overnight hospital or nursing home stays], during the last two years, since last interview before death, how many times have you seen or talked to a medical doctor about your health, including emergency room or clinic visits?"

From Wave 3A forward the question includes the addition of "Aside from any [hospital stays/hospital stays and outpatient surgery]," to the Exit Interview question.

## How Constructed

### Core Interview Variables

RwHOMCAR indicates whether the Respondent reports any home health care in the reference period. In Waves 1 and 2A the reference period is 12 months; in other waves it is the period since the last interview, or the last 2 years for new interviewees.

SwHOMCAR gives this information for the Respondent's spouse or partner.

RwHOMCAR is recoded as a yes/no indicator and for missing values. In Wave 1, the medical utilization variables are imputed in the original HRS data. Imputed values are recoded to missing. From Wave 3 forward this question is skipped if the Respondent lives in a nursing home at the time of the interview (see RwnHMLIV earlier in this section). If the question is skipped for this reason, RwHOMCAR is set to .N, the Respondent lives in a nursing home.

In Wave 2A, only the Financial Respondent was asked to answer whether themselves, their partner, or both used home health care. If the Financial Respondent answers themselves or "both," then R2HOMCAR is set to "1" for yes.

In Wave 2A, the S2HOMCAR is taken from spouses' or HH-level response. For all other waves, the spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3HOMCAR is taken from the Wave 3 spouse's R3HOMCAR variable.

### **Exit Interview Variables**

REHOMCAR indicates whether the Respondent received any home health care between the last Core Interview and death.

From Waves 2H to 5, if the Respondent lived in a nursing home at the time of death, this question is skipped and REHOMCAR is set to .N.

From Wave 6 forward, the question is skipped if the number of nights in a nursing home is continuous since the last Core Interview.

### **Core and Exit Differences**

To assign the skipped value .N, the Core uses the nursing home question on the Tracker File while the Exit uses a question on the cover sheet section of the survey.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

The questions about medical service utilization vary across waves. Wave 1 and 2A questions ask about the last 12 months, while questions in subsequent waves ask about the period since the previous interview or the last 2 years.

In Wave 1, questions ask about hospital and nursing home stays, doctor visits, and home health care. In Wave 2, questions are added that ask about prescription drugs. In Wave 2A and from Wave 3 forward, questions are added that ask about outpatient surgery, dentist, and special facilities or services.

In Wave 2A, the Financial Respondent was asked the medical utilization and expenditure questions, which differs from all other waves. Questions asked only of the Financial Respondent yield HH-level data, and those asked of all Respondents yield Respondent-level data. Note that when both levels are available the Financial Respondent's HH-level information may not agree with the information given by individual Respondents in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible for utilization variables, we use HH level data to fill missing spouse/partners' information.

For home health care, the questions in Waves 1 and 2H ask if the Respondent required any professional nursing care in their own home, and on how many days they had home nursing care. In Wave 2A and from Wave 3 on, the question asks if any medically-trained person has come to the Respondent's home to help them. In Wave 2A, only the Financial Respondent was asked to answer whether themselves, their partner or both used home health care. Beginning Wave 3, the question is skipped if the Respondent is in a nursing home. There is no follow-up question about the number of days.

### **Exit Interview Variables**

From Wave 3 forward the home health care question is skipped, and REHOMCAR is set to .N if the Respondent lived in a nursing home at the time of death (see RENHMLIV earlier in this section).

## How Constructed

### Core Interview Variables

RwDRUGS, RwOUTPT, RwDENTST, and RwSPCFAC indicate whether the Respondent reports regular use of prescription drugs, outpatient surgery, dental visits, or use of special facilities or services during the reference period. In Wave 2A the reference period is 12 months, and in subsequent waves it is the period since the last interview, or the last 2 years for new interviewees.

SwDRUGS, SwOUTPT, SwDENTST, and SwSPCFAC give this information for the Respondent's spouse or partner.

In Wave 1, questions ask about hospital and nursing home stays, doctor visits, and home health care. In Wave 2H, questions are added that ask about prescription drugs. In Wave 2A and from Wave 3 forward, questions are added that ask about outpatient surgery, dentist, and special facilities or services.

These medical care utilization variables are recoded as yes/no indicators and for missing values.

In Wave 2A, the question about outpatient surgery, dental visits, or regular use of prescription drugs was asked of financial and non-financial Respondents. When information is available for both Respondent types, the Financial Respondent's HH-level information may not agree with the information given by individual Respondents, in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible, we use HH level data to fill missing spouse/partners' information. Only the Financial Respondent was asked to answer whether themselves, their partner or both have any use of special facilities or services. If the Financial Respondent answers themselves or "both," then R2SPCFAC set to 1 for yes.

In Wave 2A, the S2DRUGS, S2OUTPT, S2DENTST is taken from spouse's or HH-level response. For all other waves, the spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3OUTPT is taken from the Wave 3 spouse's R3OUTPT variable.

## Exit Interview Variables

REDRUGS indicates whether the Respondent regularly took prescription medications before death.

RESPCFAC is an indicator for special facility or service usage. In Waves 2 through 4, if the proxy indicates the Respondent is a nursing home resident at time of death, the special facility question is skipped. A missing code .N indicating Nursing Home Resident is assigned in this case.

## Core and Exit Differences

From Core Interview Wave 2A, and from Wave 3 forward, questions are added that ask about outpatient surgery, and visits to the dentist to create RxOUTPT and RxDENTST. The Exit Interview does not have comparable questions.

## Cross Wave Differences in Original HRS Data

### Core Interview Variables

The questions about medical service utilization vary across waves. Wave 1 and 2A questions ask about the last 12 months, while questions in other waves ask about the period since the previous interview or the last 2 years.

In Wave 1, questions ask about hospital and nursing home stays, doctor visits, and home health care. In Wave 2H, questions are added that ask about prescription drugs. In Wave 2A and from Wave 3 forward, questions are added that ask about outpatient surgery, dentist, and special facilities or services.

In Wave 2A, the Financial Respondent was asked the medical utilization and expenditure questions, which differs from all other waves. Questions asked only of the Financial Respondent yield HH-level data, and those asked of all Respondents yield Respondent-level data. Note that when both levels are available the Financial Respondent's HH-level information may not agree with the information given by individual Respondents in all cases. If there is any disagreement, the Respondent's own report is used. Where necessary and possible for utilization variables, we use HH level data to fill missing spouse/partners' information.

For prescription drugs, the Wave 2H question asks if the Respondent regularly purchases medications prescribed by a doctor. In Wave 2A and from Wave 3 on, the question asks if the Respondent regularly takes prescription medications. From Wave 4 forward, if the Respondent reported taking drugs when asked about health conditions, the question is not asked, but the variable is filled indicating the use of prescription drugs (Medications Known - Assigned).

From Wave 2A and Wave 3 on, questions are added which ask if the Respondent has seen a dentist for dental care including dentures; had outpatient surgery, not counting hospital stays; and used any special facility or service not already asked about, such as an adult care center, a social worker, an outpatient rehabilitation program, or transportation or meals for the elderly or disabled. These questions are not asked in Waves 1 and 2H. In Wave 2A, only the Financial Respondent was asked to answer whether themselves, their partner, or both used special facilities or services.

### Exit Interview Variables

In Wave 2H the question is: "Did (he/she) regularly purchase medications prescribed by a Dr.?" From Wave 3 forward, the question is: "Was (he/she) regularly taking any prescription medications before (his/her) death?" From Wave 4 forward, the question includes an additional response option, "7. Yes, Medications Known." This is folded into the "Yes" response.

In Waves 3 and 4 the special facility and services question is skipped over if the Respondent was living in a nursing home or other care facility at the time of death. These cases are set to special missing character .N, meaning the Respondent lived in a nursing home.

## General Comments

Medical expenditure measures are reported in nominal dollars. When an HRS or AHEAD medical expenditure component is missing, it is imputed using the method described in the section titled "Health Care Utilization and Medical Expenditures" earlier in this document.

The HRS and AHEAD medical expenditure components are summed to create the medical expenditure measures found here in the RAND HRS Longitudinal File. For each derived medical expenditure measure, a flag indicates whether any or all of its components were imputed. Individual medical expenditure components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

### Core Interview Variables

RwOOPMD and RwOOPMDO are total out-of-pocket medical expenditures in the reference period. In Wave 2A the reference period is 12 months; in other waves it is the period since the last interview, or the last 2 years for new interviewees. RwOOPMDF and RwOOPMDOF indicate whether RwOOPMD and RwOOPMDO are imputed. RwOOPMDO and RwOOPMDOF are available from Wave 10 forward.

SwOOPMD, SwOOPMDF, SwOOPMDO and SwOOPMDOF contain this information for the Respondent's spouse or partner.

Beginning with the RAND HRS Longitudinal File 2014 (V2), we drop the total out-of-pocket medical expenditure imputations (RwOOPMD, SwOOPMD) and all related variables for Waves 1 and 2H, since these imputations are based on limited information.

In Wave 2A, only the Financial Respondent is asked about out-of-pocket expenses in two categories: (1) nursing home costs and (2) all other costs. We impute both of these at the household level, and then allocate the expense to individuals.

The household level imputed values are included (H2OOPMD), along with the individual level out-of-pocket expenses (R2OOPMD). Also, we include an additional variable for total household level out-of-pocket medical expenses (H2OOPMA) that includes all expenses, not just those for which utilization is explicitly asked, i.e., to impute using ownership=1 for all households, regardless of utilization and insurance coverage. H2OOPMD and H2OOPMA and their imputation flags are set to .Q for Wave 2H.

All components of RwOOPMD and RwOOPMDO are imputed separately and summed.

Prescription drugs, which are reported as a monthly amount, are multiplied by 24 months. In Waves 3, 4 and 5, the components of RwOOPMD are (1) hospital and nursing home costs; (2) doctor, dentist and outpatient surgery costs; (3) average monthly prescription drug costs; and (4) home health care and special facilities or services costs.

From Wave 6 forward, the components of RwOOPMD are (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) dentist costs; (5) outpatient surgery costs; (6) average monthly prescription drug costs; (7) home health care costs; and (8) special

facilities costs.

From Wave 10 forward, `RwOOPMDO` contains all of the components included in `RwOOPMD`, plus out-of-pocket costs from a ninth, catch-all "other" category.

In Wave 8 only, Respondents are asked different questions about out-of-pocket prescription drug costs depending on whether or not they have enrolled in Medicare Part D. The variable `R8PARTD` contains the flag for Medicare Part D status and has the following values: 0 = No Part D, 1 = Part D but no change, and 2 = Part D and change in use or cost. The variable `R8MDRUG` can be found in the RAND HRS Detailed Imputations File.

In Wave 2A, the `S2OOPMD`, `S2OOPMDF` variables are taken from spouses' or household level response. For all other waves, the spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., `S3OOPMD` is taken from the Wave 3 spouse's `R3OOPMD`.

Beginning with the RAND HRS Longitudinal File 2014 (V2), we reintroduce the variables that contain the continuous amounts for total medical expenditures, including that paid by insurance (`R3TOTMD`), for Wave 3H, variables that were present in the RAND HRS Longitudinal File prior to Version M. `R3TOTMDF` indicates whether `R3TOTMD` is imputed. For Wave 3A, these variables are set to .Q.

Also beginning with the RAND HRS Longitudinal File 2014 (V2), we drop the variables that contain the reported bracket information for total medical expenditures, including that paid by insurance (`RwTOTMB`, `SwTOTMB`), for Waves 3 to 6. Interested users can obtain this information by merging the RAND HRS Longitudinal File with the RAND HRS Fat File for a given wave by `HHIDPN`. The RAND HRS Fat Files contain most of the original HRS variables, with household data merged to the Respondent level.

`RwTOTMBI` and `RwTOTMBF` are available from Waves 3 to 6. `RwTOTMBI` provides the estimated bracket for total medical expenditures, including that paid by insurance. This information is obtained from unfolding bracket questions, except if a continuous amount is given in Wave 3H, and complete brackets are imputed when incomplete bracket information is provided. `RwTOTMBF` indicates whether `RwTOTMBI` is imputed.

`S3TOTMD`, `S3TOTMDF`, `SwTOTMBI` and `SwTOTMBF` contain this information for the Respondent's spouse or partner.

A number of covariates are used in the imputations including health insurance as derived for this file (`RwHIGOV`, `RwCOVR`, `RwCOVS`, `RwHIOTHP`). Please see the section titled "Health Care Utilization and Medical Expenditures" earlier in this document for a description of the imputation method.

### **Exit Interview Variables**

`REOOPMD` and `REOOPMDO` are total out-of-pocket medical expenditures between the last interview and time of death. `REOOPMDF` and `REOOPMDOF` indicate whether `REOOPMD` and `REOOPMDO` are imputed. For Respondents whose Exit Interview was conducted in Wave 2H, all medical expenditure variables are set to .Q, since there is limited information for this wave.

All components of `REOOPMD` and `REOOPMDO` are imputed separately and summed. Individual medical expenditure components and imputation flags are available in the RAND HRS Detailed Imputations File.

Prescription drugs, which are reported as a monthly amount, are multiplied by months between last interview and death. Information about the date of the last interview was taken from the preloads, since this is what interviewers used when asking the questions about health care utilization and medical expenditures. Therefore, months between last interview and death is occasionally different from the `RADTIMTDTH` variable. If the preloads are missing, the value is multiplied by 24 (for 2 years, consistent with what proxies are asked with missing preloads). If the months between last interview and death are less than or equal to 0, the value is multiplied by 1 (for one month).

For Exit Interviews conducted in Waves 3, 4 and 5, the components of `REOOPMD` are (1) hospital and nursing home costs; (2) doctor visit costs; (3) average monthly prescription drug costs; (4) home health care and special facilities or services costs; and (5) hospice costs.

For Exit Interviews conducted from Wave 6 to Wave 9, the components of REOOPMD are (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) average monthly prescription drug costs; (5) home health care costs; (6) special facilities costs; and (7) hospice costs.

For Exit Interviews conducted from Wave 10 forward, the components of REOOPMD are (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) dentist costs; (5) outpatient surgery costs; (6) average monthly prescription drug costs; (7) home health care costs; (8) special facilities costs; and (9) hospice costs.

Note that for Exit Interviews conducted in Wave 11 and before, hospice costs include facility-based hospice costs only. For Exit Interviews conducted from Wave 12 forward, hospice costs include all forms of hospice care, including facility-based care and hospice care at home.

REOOPMDO contains all of the components included in RWOOPMD, plus out-of-pocket costs from a catch-all "other" category.

### **Core and Exit Differences**

For total out-of-pocket medical expenditures, there are several differences to note between the Core and Exit variables: (1) for Respondents whose Exit Interview was conducted in Wave 2H, all medical expenditure variables are set to .Q, since there is limited information for this wave; (2) the Exit variables include hospice care, while the Core variables do not (please note the cross-wave differences in the definition of hospice care for the Exit variables); (3) the catch-all "other" category is present in all waves (from Wave 3 forward) of the Exit variables; (4) dentist costs and outpatient surgery costs are not asked until Wave 10 of the Exit Interview; (5) the reference period for the Exit variables is the number of months between the last interview and death, compared to "since the last interview" for the Core variables; and (6) we do not create Exit Interview equivalents of the Core total medical expenditures variables (R3TOTMD/S3TOTMD, R3TOTMDF/S3TOTMDF, RWTOTMBI/SWTOTMBI, RWTOTMBF/SWTOTMBF).

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

In Wave 2A, all Respondents are asked about medical utilization in the last 12 months, and separate questions about out-of-pocket costs for nursing home and all other out-of-pocket medical costs are asked only of the Financial Respondent.

From Wave 3 forward, medical utilization questions cover the last 2 years or the period since last interview. In Waves 3, 4 and 5, questions ask separately about out-of-pocket costs for four categories of services: (1) hospital/nursing home; (2) doctor visits; (3) prescription drugs per month; and (4) in-home medical care/special facilities.

From Wave 6 forward, questions on individual categories are asked separately. In Waves 6-9, questions are asked about eight categories of out-of-pocket medical costs: (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) dental costs; (5) outpatient surgery costs; (6) average monthly prescription drug costs; (7) home health care; and (8) special facilities costs.

From Wave 10 forward, a ninth category seeks to capture any additional out-of-pocket medical expenditures that cannot be assigned to any of the other categories. We include two estimates of out-of-pocket medical expenditures for these latest waves: RWOOPMD, which allows for longitudinal analysis, contains the eight components present in Waves 6-9, and RWOOPMDO, which includes the "other" spending category in the estimate of total out-of-pocket medical expenditures.

In Waves 1 and 2, there are no questions about the total costs of all medical services.

In Wave 3H, Respondents are asked to estimate total medical costs for all medical services since the previous interview. If the Respondent does not provide an exact amount, unfolding bracket follow-up questions are asked. In Wave 3A and from Waves 4 to 6, an exact amount of total expenditures is not asked; all Respondents are directed into unfolding bracket questions.

Unlike from Wave 4 forward, where Respondents who answer the unfolding bracket questions are given the option of saying that the amount was "about" equal to a certain value, there is no such option in Wave 3. In Wave 3A, the unfolding bracket questions

ask, "Do you think the total costs were more than \$5,000?" and follow up with ascending or descending amounts based on the answer. In Wave 3H, however, the unfolding bracket questions ask, "Did it amount to \$5,000 or more?" Therefore, for Wave 3A, the bracket "0 to 1000-" means "0 to 1000," the bracket "1001 to 5000-" means "1001 to 5000," and so on. For Wave 3H, the bracket "0 to 1000-" means "0 to 999," the bracket "1001 to 5000-" means "1000 to 4999," and so on.

From Wave 7 forward, there are no questions about total medical expenditures.

In Wave 8 only, Respondents are asked different questions about out-of-pocket prescription drug costs depending on whether or not they have enrolled in Medicare Part D. For those whose prescription drug use and cost are unaffected by Medicare Part D, the reported or imputed monthly average is multiplied by 24 months to estimate drug costs for the last two years. For those enrolled, two questions ask if their use or costs of prescription drugs changed. If the answer to either of these questions is "yes," then Respondents report two average monthly out-of-pocket amounts: one for the 12 months prior to coverage under Part D and another for the 12 months after. Total prescription drug costs for the last two years in Wave 8 is, then, calculated as:

$$R8MDRUG = [\# \text{ Months post-Part D} * \text{ expenses post-Part D}] + [(24 - \# \text{ Months post-Part D}) * \text{ expenses pre-Part D}]$$

The variable R8PARTD contains the flag for Medicare Part D status, and has the following values: 0 = No Part D, 1 = Part D but no change, and 2 = Part D and change in use or cost. The variable R8MDRUG can be found in the RAND HRS Detailed Imputations File.

Beginning with Tracker 2004 V1 (Wave 7), HRS has implemented a verified nursing home residence flag for each wave, xNURSHM, e.g., GNURSHM for Wave 5 (2000). From Wave 5 forward, there are cases at each interview where this information conflicts with nursing home residency reported in the core data cover sheet section. In the questions about nursing home utilization, a cover-sheet reporting a nursing home resident is assigned as "Yes" for any nursing home stays by default. In some cases where Tracker indicates residence is NOT a nursing home, the interviewer overwrites this with a "No" for any nursing home stays, but in many cases, this does not occur. We examine these cases for length of stay, residency move-in date, and missing answers to estimate whether there is any nursing home utilization besides the residency reported in the core data, which HRS has determined is NOT a nursing home. Please see "Medical Care Utilization: Nursing Home" for more details on how these items are assessed.

### **Exit Interview Variables**

For Respondents whose Exit Interview was conducted in Wave 2H, all medical expenditure variables are set to .Q, since there is limited information for this wave.

From Wave 3 forward, medical utilization questions cover the period between the last interview and time of death.

For Exit Interviews conducted in Waves 3, 4 and 5, questions ask separately about out-of-pocket costs for the following categories of service: (1) hospital and nursing home costs; (2) doctor visit costs; (3) average monthly prescription drug costs; (4) home health care and special facilities or services costs; (5) hospice costs; and (6) other out-of-pocket medical expenditure costs.

For Exit Interviews conducted from Wave 6 to Wave 9, questions ask separately about out-of-pocket costs for the following categories of service: (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) average monthly prescription drug costs; (5) home health care costs; (6) special facilities costs; (7) hospice costs and (8) other out-of-pocket medical expenditure costs.

For Exit Interviews conducted in Wave 10 forward, questions ask separately about out-of-pocket costs for the following categories of service: (1) hospital costs; (2) nursing home costs; (3) doctor visits costs; (4) dentist costs; (5) outpatient surgery costs; (6) average monthly prescription drug costs; (7) home health care costs; (8) special facilities costs; (9) hospice costs, and (10) other out-of-pocket medical expenditure costs.

Note that for Exit Interviews conducted in Wave 11 and before, hospice costs include facility-based hospice costs only. For Exit Interviews conducted from Wave 12 forward, hospice costs include all forms of hospice care, including facility-based care and hospice care at home.

## Categorical Variable Codes

---

R1DEPREX: CESD: Felt depressed-raw

---

Value		w1
1.All or almost all		298
2.Most of the time		371
3.Some of the time		3090
4.None or almost none		8893

## SlDEPREX: CESD: Felt depressed-raw

Value	w1
.U=Unmarried	2373
.V=Spouse NR	379
1.All or almost all	186
2.Most of the time	237
3.Some of the time	2252
4.None or almost none	7225

## How Constructed

RwDEPRES, RweFFORT, RwsLEEPR, RwwHAPPY, RwFLONE, RwFSAD, RwGOING, and RwenLIFE are yes/no indicators of the Respondent's feelings much of the time over the week prior to the interview. RwcESD is a summary of these measures. RwcESDM indicates how many individual measures used to derive RwcESD are missing.

SwDEPRES, SwEFFORT, SwSLEEPR, SwWHAPPY, SwFLONE, SwFSAD, SwGOING, SwENLIFE, SwCESD, and SwCESDM are this information for the Respondent's spouse or partner.

To make consistent measures across waves, yes/no dummy variables were derived. In all except Wave 1, the question has a "yes" or "no" response to whether the Respondent felt a certain way "much of the time." The questions are not asked to proxy Respondents and the variables are set to .S=Skip, question not asked.

For Wave 1, the response could be one of four categories: "all or almost all of the time," "most of the time," "some of the time," or "none or almost none of the time." The measures in this wave are not recoded to 0/1 (no/yes), but are recoded to the 4-point scale. These measures were imputed by HRS if missing in Wave 1, and the imputations were used. Because the Wave 1 variables are very different from those in other waves, the variables are named differently, i.e., they are R1DEPREX, R1EFFFORX, R1SLEEPX, R1WHAPPX, R1FLONEX, R1FSADX, R1GOINGX, and R1ENLIFX. The spouse measures are called S1DEPREX, S1EFFFORX, S1SLEEPX, S1WHAPPX, S1FLONEX, S1FSADX, S1GOINGX, and S1ENLIFX.

It appears "much of the time" in later waves is somewhere between "some" and "most" of the time in Wave 1. Another variable in the HRS (but not on this file) rates overall emotional health, and is asked in Waves 1 and 2H. A possible means for making these measures more consistent between Wave 1 and the rest of the waves is to use those who gave the same emotional health in both Waves 1 and 2H, comparing their answers of "some" and "yes" by level of emotional health.

RwcESD is the sum of RwDEPRES, RweFFORT, RwsLEEPR, (1-RwwHAPPY), RwFLONE, RwFSAD, RwGOING, and (1-RwenLIFE). Thus the higher the score, the more negative the Respondent's feelings in the past week. The input variables are not asked to proxy Respondents and RwcESD is set to .S in these cases. RwcESDM counts the number of missing values among the individual measures. In Wave 1 the R1CESD summary measure is not included; R1CESDM counts the number of imputed values used

among the Wave 1 measures.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3CESD is taken from the Wave 3 spouse's R3CESD.

## Cross Wave Differences in Original HRS Data

In each wave questions ask about the Respondent's feelings in the past week. The wording of the questions varies slightly across waves.

In Wave 1, the questions begin:

"Please tell me how often you have experienced the following feelings during the past week—all or almost all of the time, most of the time, some of the time, or none or almost none of the time. During the past week..."

A series of statements follow and the Respondent answers with one of the four frequencies listed in the question.

From Wave 2 forward, the questions start:

"Now think about the past week and the feelings you have experienced. Please tell me if each of the following was true for you much of the time this past week. Much of the time during the past week ..."

A series of statements follow to which the Respondent can answer "yes" or "no." Note that the responses given in Wave 1 are very different and not very comparable to those given in later waves.

The statements are similar across waves. They state that the Respondent felt depressed, felt that everything they did was an effort, sleep was restless, could not get going, felt lonely, enjoyed life, felt sad, and was happy.

## How Constructed

RwHIBP, RwDIAB, RwcANCR, RwlLUNG, RwhHEART, RwsSTROK, RwsPSYCH, RwsARTHR, and RwsSLEEP indicate the raw response to the question regarding whether or not a doctor has told the Respondent they had these conditions. The exact question wording depends on whether this is a first interview and whether the condition was reported at a prior interview. Additionally, for all of these variables with the exception of RwsSLEEP, the question asked is also conditional on whether the person being interviewed is the same as in the prior interview. RwhIBPQ, RwdIABQ, RwcANCRQ, RwlLUNGQ, RwhHEARTQ, RwsSTROKQ, RwsPSYCHQ, RwsARTHRQ, and RwsSLEEPQ indicate the question wording used, based on preload variables, and whether the preloaded information is correct.

The conditions are 1) high blood pressure or hypertension; 2) diabetes or high blood sugar; 3) cancer or a malignant tumor of any kind except skin cancer; 4) chronic lung disease except asthma such as chronic bronchitis or emphysema; 5) heart attack, coronary

heart disease, angina, congestive heart failure, or other heart problems; 6) stroke or transient ischemic attack (TIA); 7) emotional, nervous, or psychiatric problems; 8) arthritis or rheumatism; and 9) sleep disorders.

The question wording is one of the following (main codes in "Q" variables are given in parentheses):

If new interview, or from Wave 6 forward, new person answering questions (1.NewIvw or 5.ReIvw/NewR): "Has a doctor ever told you that you have ..."

If reinterview and no prior report of condition (2.ReIvw,NoCond): "Since we last talked to you (on R's last interview date), has a doctor told you that you have ..."

From Wave 14 forward, if: (1) reinterview, (2) same reporter, and (3) prior report of condition, the interviewer assigns "1" to the initial condition question and skips the Respondent to the follow-up question. The Respondent may dispute reporting previously having had a condition in the follow-up question. When this happens, the interviewer retroactively codes the first condition question as a hidden value with either "4.Never had condition" or "6.Had condition before, but do not have it now." Beginning with Wave 14, there is no longer the option to dispute a preload value indicating the Respondent reported NOT having the condition previously ("3.Disputes previous wave record, but now has condition").

From Waves 3 to 13, if reinterview and prior report of condition (3.ReIvw,Cond): "Our records from your last interview show that you have had ...," and the Respondent has the opportunity to dispute the statement.

In Wave 2H, if it is a reinterview and the condition is reported in Wave 1 (4.ReIvw,Cond), the question is skipped, except for the heart condition question which asks about the time since last interview (6.ReIvw,Cond: told had since last Ivw). Wave 2A is the first wave for AHEAD Respondents so they are all new interviews.

In Wave 2A, the HRS-AHEAD overlap cases are treated as though this is their first interview. These cases have a Wave 1 interview as part of the HRS cohort, but because of their ages, are given to AHEAD in 1993. So in both 1992 and 1993, they are asked: "Has a doctor ever told you that you have...." These cases are assigned a code of "10" in Wave 2A. They may or may not have reported having the condition in Wave 1.

The "Q" variables have additional codes that indicate situations where the preload variables determine the question wording, but do not agree with the actual situation in prior waves. For example, "11" means that the Respondent has a prior interview, but the preload indicates this is a new interview, so the question asks if the Respondent has ever been told about a condition, and "15" means that the Respondent previously reported having a condition but the preload indicates a prior interview and no condition, so the question asks if the Respondent has been told about a condition since last interview. In the latter case, an answer of "No" is consistent with having been told of the condition at or before the last interview, but not since. Codes "18" and "19" apply only to the question about a heart condition in Wave 2H.

RwHIBP, RwDIAB, RwcANCER, RwlLUNG, RwhHEART, RwsSTROK, RwsPSYCH, and RwsARTHR are recoded to reflect the answer given. Note that there is not an option to dispute a prior report of RwsSLEEP, and therefore, no values are recoded. The meaning of the answer depends on the question asked, so the analyst may want to consider these variables in conjunction with the corresponding "Q" variables. Generally, a "1" means "yes" and "0" means "no." Note that for a re-interview, when the condition was previously reported, a "1" in this variable simply means the Respondent did not dispute the statement about the records from last interview. In Waves 3 and 4, this can be disputed, but no follow-up as to whether the Respondent currently has the condition is done; these are assigned a code of "5." From Waves 5 through 13, the interviewer is asked to probe for current condition if the statement is disputed; these are assigned a code of "3" or "4," depending on whether the Respondent says they have the condition now or not, respectively. From Wave 14 forward and with the exception of RwsSLEEP, the interviewer can retroactively assign "hidden" values of "4. Never had [condition]" or "6. Had [condition] before, but do not have it now..." if in the subsequent question the Respondent disputes a prior report of having had the condition.

In Wave 2H, if the question is skipped because the preload indicates the condition was reported in Wave 1, the condition variable is set to .Y if the condition is indeed reported in Wave 1, and .P if the condition is not reported in Wave 1. R4HEART is set to "6" if the raw variable indicates that the incorrect question is asked due to a preload problem, and the Respondent reports no condition since last interview. These cases had previously reported a heart condition.

SwHIBP, SwDIAB, SwCANCR, SwLUNG, SwHEART, SwSTROK, SwPSYCH, SwARTHR, SwHIBPQ, SwDIABQ, SwCANCRQ, SwLUNGQ, SwHEARTQ, SwSTROKQ, SwPSYCHQ, SwARTHRQ, and SwSLEEPQ give this information for the Respondent's spouse or partner.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3HIBP is taken from the Wave 3 spouse's R3HIBP variable.

Please see RwhIBPE, RwdIABE, RwcANCRE, RwlUNGE, RwhEARTE, RwsTROKE, RwpSYCHE, RwarTHRE, and RwsLEEPE for variables that indicate whether the Respondent has ever reported having these conditions. The "E" variables consider answers from all previous waves and not just the current one.

Please see the 'Change in Health' variables as well. Included there are variables that measure whether the individual conditions are new in a particular wave, i.e., reported as new since the last interview date. There is a summary measure for these new conditions as well.

### **Cross Wave Differences in Original HRS Data**

A series of questions asks the Respondent if a doctor has ever diagnosed them with certain medical conditions. At a Respondent's first interview, the question asks:

"Has a doctor ever told you that you have ..."

From Wave 6 forward for all conditions except RwsSLEEP, if the person answering the questions is new, the question is asked as though it were the first interview, regardless of what had been reported at prior interviews. Thus if the prior interview was given by the Respondent and the current is by proxy, or vice versa, or if both interviews are by proxy but conducted with different people, then this is treated like a first interview and the ever question wording is used. The sleep disorder question does not factor in proxy respondents. Respondents are only asked the "first interview" question if it is the Respondent's first time receiving the question.

At subsequent interviews, the question wording depends on whether the appropriate preloaded variable indicates that the Respondent has said yes to the condition at a prior interview. If not, the question wording is:

"Since we last talked to you in [last interview date], has a doctor told you that you have ..."

How Respondents are handled who had reported a condition at a prior interview varies across waves. In Wave 2H, if the preloaded variable indicates that the Respondent reported the condition in Wave 1, no question is asked for most conditions. For heart problems, the above question is asked regardless of the preloaded variable value; if the preloaded variable indicates a Wave 1 heart problem, it is prefaced by a statement that a heart condition has already been reported.

For Waves 3 through 13, if the preloaded variable indicates that the Respondent reported a condition at a prior interview, a statement is read:

"Our records from your last interview show that you have had ..."

No explicit question is asked. If the Respondent disputes the statement voluntarily, this is recorded, but no follow-up on the current diagnosis of the condition is asked in Waves 3 and 4. From Waves 5 through 13, if the Respondent disputes the statement, the interviewer is instructed to probe as to whether or not the Respondent has since been diagnosed with the condition. The dispute is recorded as "disputes previous wave record but now has the condition" or "disputes and does not have the condition." Most disputes are of the latter type. If the Respondent does not dispute the statement, the variable that indicates the diagnosis of the condition is set to "yes."

From Wave 14 forward and excluding questions about sleep disorders, the statement affirming the Respondent reported a condition at a prior interview is read in the subsequent question, again, with the interviewer retroactively coding a dispute in a "hidden" value for the initial question, "Have you ever..."

In Wave 4, an alternate variable is provided for the heart condition question (F1156A). Apparently a skip pattern problem in this wave causes some cases who had previously reported a heart condition to be asked if they'd been told they had one since last interview, and some respond "No." These cases are identified in F1156A.

In Wave 2A and from Wave 3 forward, a code for "possible stroke or transient ischemic attack (TIA)" is added, if the Respondent volunteered this information in answer to the question about strokes. This code is not available in Waves 1 and 2H. TIA is treated the same as a "yes" answer in deriving RwSTROKE (Ever had stroke), but is coded separately in RwSTROK.

The definition of "doctor" in Wave 6 was: Medical doctors include specialists such as: Dermatologists, Psychiatrists, Ophthalmologists, as well as general practitioners, and Osteopaths. Do not include Chiropractors, Dentists, or Nurses/Nurse Practitioners.

In Wave 7 this was expanded as follows: Medical doctors include specialists such as Dermatologists, Psychiatrists, Ophthalmologists, Osteopaths, Cardiologists, as well as family doctors, internists and physicians' assistants.

### How Constructed

RwHIBPE, RwDIABE, RwCANCRE, RwLUNGE, RwHEARTE, RwSTROKE, RwPSYCHE, and RwARTHRE are indicator variables denoting whether or not the Respondent reports a doctor has ever told them that they had the specified condition. The conditions are 1) high blood pressure or hypertension; 2) diabetes or high blood sugar; 3) cancer or a malignant tumor of any kind except skin cancer; 4) chronic lung disease except asthma such as chronic bronchitis or emphysema; 5) heart attack, coronary heart disease, angina, congestive heart failure, or other heart problems; 6) stroke or transient ischemic attack (TIA); 7) emotional, nervous, or psychiatric problems; and 8) arthritis or rheumatism. From Wave 13 forward, RwsLEEPE indicates whether or not the Respondent reports that a doctor or other health professional has ever told them that they had a sleep disorder.

Each of these variables is set to "1" if the Respondent ever answered "yes" to the pertinent question in the current or any prior wave and is otherwise set to "0." In cases where a Respondent later disputes a report from a prior wave, these "Ever" variables reflect the corrections made after the Respondent's disputed prior report. Notably, if a Respondent reports they don't know or refuses to answer whether a doctor has given them this information, they are also coded as "0."

RAHIBPEF, RADIABEF, RACANCREF, RALUNGEF, RAHEARTEF, RASTROKEF, RAPSYPHEF, RAARTHREF, and RASLEEPEF are flag variables which give the first time, if ever, a Respondent gives a response of "Don't Know," refused to answer the question or was inadvertently skipped over the question.

Since Wave 2A is the first wave for AHEAD Respondents, questions are asked for all Respondents, unlike Wave 2H, where questions are skipped if reported as a condition in Wave 1.

From Wave 3 forward, if a preloaded variable so indicates, the Respondent is read a statement that HRS records show they reported a condition at a prior interview. Any voluntary disputes of this statement are recorded. If there is no dispute, the condition variable is coded in the raw HRS data as "yes."

If a condition is disputed, all prior wave reports are set to "no." For example, if a report of high blood pressure is disputed in Wave 3, then R1HIBPE and R2HIBPE are set to "no."

In Waves 3 and 4, if a previous wave report of a condition is disputed, no follow-up question asks whether a doctor has told the Respondent they have the condition since the previous wave, and it is assumed that the Respondent does not have the condition in the current wave as well. From Waves 5 through 13, the interviewer records the dispute along with an indication of whether the Respondent currently has the condition. If the Respondent says they currently have it, the current wave variable is set to "yes," and if not, it is set to "no." From Wave 14 forward, there is no longer the "3.Disputes previous wave record, but now has condition" option. If the Respondent has previously reported having the condition, they are coded "1.Yes" for the condition and skipped to the subsequent condition question. If they dispute having the condition, they are either coded as "4. Never had <condition>" or "6. Had <condition> but do not have it now." As noted previously, the sleep disorder questions are the only conditions that do not allow for disputes of previous reports.

If the presence of a condition was preloaded in a particular wave and not disputed, but prior wave data does not show a previous report,

it is assumed that the Respondent is reporting the condition at that wave. For example, if the Respondent did not dispute a statement in Wave 3 that they had reported having high blood pressure at a prior interview, but both R1HIBPE and R2HIBPE are "no," then R3HIBPE is set to "yes."

Note that as more waves are added where conditions could be disputed, we notice that for some conditions, Respondents who dispute may have reported receiving treatment or medications for the disputed condition in a prior wave. It may be that the question is interpreted by the Respondent as whether they have the condition now, particularly for conditions that can be brought under control, such as high blood pressure. Also, disputes are more likely to affect earlier waves than later ones, simply because there have been more opportunities for disputing past answers as time goes on. This time series is not appropriate for tracking changes in the prevalence over time and the version of these variables without disputes incorporated should be used instead. Please see the raw recodes of these variables in "Doctor diagnosed health problems: Raw recodes and question wording." Note that the raw recodes have not been recoded into 0/1 dummy variables, and do not necessarily reflect condition reports from prior waves.

RwHIBPF, RwDIABF, RwCANCRF, RwLUNGF, RwHEARTF, RwSTROKF, RwPSYCHF, and RwARTHRF indicate whether a condition is disputed at the current or a later interview. Because there is not an option in the questionnaire to dispute the "have you ever had a sleep disorder" question, there is not a flag for this condition. The codes for the flag variables are: 0) no dispute and no change; 1) no dispute of preload indicating prior report of condition, but data shows no prior report of condition - set current report to yes; 2) disputes preload indicating prior report of condition, and data shows no prior report of condition - set current report to no; 3) disputes preload indicating prior report of condition, and data agrees with preload, set current and prior waves to no; 4) dispute of preload at a later wave would change this wave's report to no, but this wave's report was already no; 6) dispute of preload at a later wave has changed this wave's report from yes to no; 7) preload was disputed at a previous wave, current wave response is no, set to no; 8) preload was disputed at a previous wave, but now has condition; 10) new Respondent is asked the ever question and says no condition, but condition was reported in a prior wave, keep yes.

RwCONDE gives the number of conditions the Respondent reports ever having. It is the sum of individual condition variables. Note that this implicitly treats all missing values as "No" in the sum. RwCONDEF count how many individual condition reports in the sum were changed because of disputes. These variables do not include RwsLEEPE in the sums because it was first asked in Wave 13. They only include the eight original "ever had" conditions.

SwHIBPE, SwDIABE, SwCANCRE, SwLUNGE, SwHEARTE, SwSTROKE, SwPSYCHE, SwARTHRE, SwSLEEPE, SwHIBPF, SwDIABF, SwCANCRF, SwLUNGF, SwHEARTF, SwSTROKF, SwPSYCHF, SwARTHRF, SwCOND, and SwCONDEF give this information for the Respondent's spouse or partner.

SwHIBPEF, SwDIABEF, SwCANCREF, SwLUNGEF, SwHEARTEF, SwSTROKEF, SwPSYCHEF, SwARTHREF, and SwSLEEPEF indicate the first wave, if ever, the Respondent's spouse or partner gave a response of "Don't Know," refused to answer the question or was inadvertently skipped over the condition question.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3HIBPE is taken from the Wave 3 spouse's R3HIBPE variable.

Please see the "Change in Health" variables as well. Included there are variables that measure whether the individual conditions are new in a particular wave, i.e., reported as new since the last interview. There is a summary measure for these new conditions as well.

Please see RwHIBP, RwDIAB, RwCANCR, RwLUNG, RwHEART, RwSTROK, RwPSYCH, and RwARTHR for the raw reports at each wave, and RwhIBPQ, RwdIABQ, RwcANCRQ, RwlLUNGQ, RwhHEARTQ, RwsTROKQ, RwpSYCHQ, and RwarthRQ for an indication of the question wording used. The description of these variables can be found under "Doctor diagnosed health problems: Raw recodes and question wording."

## Cross Wave Differences in Original HRS Data

A series of questions asks the Respondent if a doctor has ever diagnosed them with certain medical conditions. At a Respondent's first interview, Waves 1 and 2A, the question asks:

"Has a doctor ever told you that you have ..."

From Wave 6 forward, if the person answering the questions is new, the question is asked as though it were the first interview, regardless of what had been reported at prior interviews. Thus, if the prior interview was given by the Respondent and the current is by proxy, or vice versa, or if both interviews are by proxy but conducted with different people, then this is treated like a first interview and the ever question wording is used.

At subsequent interviews, the question wording depends on whether the appropriate preloaded variable indicates that the Respondent has said "yes" to the condition at a prior interview. If not, the question wording is:

"Since we last talked to you, that is since [last interview date], has a doctor told you that you have ..."

From Wave 14 forward if it is a reinterview of the same reporter as the previous wave and if the Respondent/reporter reported having had the condition, then a value of "1. Yes" is assigned to the "...has a doctor told you that you have the condition" and the Respondent is skipped to the subsequent question.

There is variation across the waves on whether and which question Respondents are asked if they had previously reported a condition at a prior interview. In Wave 2H, if the preloaded variable indicates that the Respondent reported the condition in Wave 1, no question is asked for most conditions. For heart problems, the above question is asked regardless of the preloaded variable value; if the preloaded variable indicates a Wave 1 heart problem, it is prefaced by a statement that a heart condition has already been reported.

From Wave 3 forward, if the preloaded variable indicates that the Respondent reported a condition at a prior interview, a statement is read:

"Our records from your last interview show that you have had ..."

No explicit question is asked. If the Respondent disputes the statement voluntarily, this is recorded, but no follow-up on the current diagnosis of the condition is asked in Waves 3 and 4. From Waves 5 through 13, if the Respondent disputes the statement, the interviewer is instructed to probe as to whether or not the Respondent has since been diagnosed with the condition. The dispute is recorded as "disputes previous wave record but now has the condition" or "disputes and does not have the condition." Most disputes are of the latter type. If the Respondent does not dispute the statement, the variable that indicates the diagnosis of the condition is set to "yes." From Wave 14 forward if it is a reinterview of the same reporter as the previous wave and if the Respondent/reporter reported having had the condition, then a value of "1. Yes" is assigned to the "...has a doctor told you that you have the condition" and the Respondent is skipped to the subsequent question. However, in the subsequent question, the Respondent can dispute having previously had the condition. In these cases, the interviewer overwrites the "Has a doctor told you that you have <condition>" with either a value of "4.Never had <condition>" or "6.Had <condition> but do not have it now."

In Wave 4, an alternate variable is provided for the heart condition question (F1156A). Apparently, a skip pattern problem in this wave causes some cases who had previously reported a heart condition to be asked if they had been told they had one since last interview, and some respond "No." These cases are identified in F1156A.

In Wave 2A and from Wave 3 forward, a code for "possible stroke or transient ischemic attack (TIA)" is added, if the Respondent volunteered this information in answer to the question about strokes. This code is not available in Waves 1 and 2H. TIA is treated the same as a "yes" answer in deriving RwSTROKE.

The definition of "doctor" in Wave 6 was: Medical doctors include specialists such as, Dermatologists, Psychiatrists, Ophthalmologists, as well as general practitioners, and Osteopaths. It does not include Chiropractors, Dentists, or Nurses/Nurse Practitioners.

In Wave 7, this was expanded as follows: Medical doctors include specialists such as Dermatologists, Psychiatrists, Ophthalmologists, Osteopaths, Cardiologists, as well as family doctors, internists and physicians' assistants.

From Wave 10 forward, the definition was further expanded to say:

"Medical doctors include specialists such as Dermatologists, Psychiatrists, Ophthalmologists, Osteopaths, Cardiologists, as well as family doctors, internists and physicians' assistants. Also include diagnoses made by Nurses and Nurse Practitioners."

From Wave 13 forward, the Respondent is asked whether "a doctor or other health professional" has told the Respondent they have a sleep disorder. A more detailed list of specific professions is not given.

## Categorical Variable Codes

### RwMEMORY: R reports memory prob this wv

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
.D=DK				13	7	11	16	14	17	
.M=Oth missing								1		
.R=RF				1	2	2	2	4	3	
.Y=Via preload+yes prev wv					350	165	368	522		
0.No				20834	18868	17468	19228	17490	16167	
1.Yes				536	351	519	515	438	948	
3.Disp prev record and has									1	
4.Disp prev record and no c									81	

Value	w11	w12	w13	w14	w15
.D=DK					
.M=Oth missing					
.R=RF					
.Y=Via preload+yes prev wv					
0.No					
1.Yes					
3.Disp prev record and has					
4.Disp prev record and no c					

### SwMEMORY: S reports memory prob this wv

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
.D=DK				4	6	3	4	6	4	
.R=RF					1	2	1	2	2	
.U=Unmarried				6868	6537	6306	6777	6417	6206	
.V=Spouse NR				536	311	220	380	317	365	
.Y=Via preload+yes prev wv					176	80	169	235		
0.No				13715	12394	11348	12582	11295	10183	
1.Yes				261	153	206	216	197	415	
4.Disp prev record and no c									42	

Value	w11	w12	w13	w14	w15
.D=DK					
.R=RF					
.U=Unmarried					
.V=Spouse NR					
.Y=Via preload+yes prev wv					
0.No					
1.Yes					
4.Disp prev record and no c					

## RwMEMRYQ: Q-wording memory prob this wv

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
1.NewIvw: have had [ever]				21384	265	226	3471	207	143	
2.ReIvw,NoCond: have had si					18504	16322	15163	16628	15634	
3.ReIvw,Cond: last time sai									543	
4.ReIvw,Cond: skip question					350	165	368	522		
5.ReIvw/NewR: have ever had						1072	959	1020	816	
11.ReIvw BUT Pre=NewIvw: ha					5	6	5	6		
12.NewIvw BUT Pre=ReIvw,NoC					454	172	71	23	13	
15.ReIvw,Cond BUT Pre=NoCon						202	92	63	68	

Value	w11	w12	w13	w14	w15
1.NewIvw: have had [ever]					
2.ReIvw,NoCond: have had si					
3.ReIvw,Cond: last time sai					
4.ReIvw,Cond: skip question					
5.ReIvw/NewR: have ever had					
11.ReIvw BUT Pre=NewIvw: ha					
12.NewIvw BUT Pre=ReIvw,NoC					
15.ReIvw,Cond BUT Pre=NoCon					

## SwMEMRYQ: Q-wording memory prob this wv

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
.U=Unmarried				6868	6537	6306	6777	6417	6206	
.V=Spouse NR				536	311	220	380	317	365	
1.NewIvw: have had [ever]				13980	247	209	2484	198	139	
2.ReIvw,NoCond: have had si					12060	10525	9649	10593	9747	
3.ReIvw,Cond: last time sai									250	
4.ReIvw,Cond: skip question					176	80	169	235		
5.ReIvw/NewR: have ever had						648	577	668	474	
11.ReIvw BUT Pre=NewIvw: ha					4	6	5	6		
12.NewIvw BUT Pre=ReIvw,NoC					243	78	42	8	5	
15.ReIvw,Cond BUT Pre=NoCon						93	46	27	31	

Value	w11	w12	w13	w14	w15
.U=Unmarried					
.V=Spouse NR					
1.NewIvw: have had [ever]					
2.ReIvw,NoCond: have had si					
3.ReIvw,Cond: last time sai					
4.ReIvw,Cond: skip question					
5.ReIvw/NewR: have ever had					
11.ReIvw BUT Pre=NewIvw: ha					
12.NewIvw BUT Pre=ReIvw,NoC					
15.ReIvw,Cond BUT Pre=NoCon					

## RwMEMRYE: R ever had memory problem

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
0.No				20851	18892	17395	19201	17491	16176	
1.Yes				533	686	770	928	978	1041	

Value	w11	w12	w13	w14	w15
0.No					
1.Yes					

## SwMEMRYE: S ever had memory problem

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
.U=Unmarried				6868	6537	6306	6777	6417	6206	
.V=Spouse NR				536	311	220	380	317	365	
0.No				13721	12412	11314	12582	11304	10191	
1.Yes				259	318	325	390	431	455	

Value	w11	w12	w13	w14	w15
.U=Unmarried					
.V=Spouse NR					
0.No					
1.Yes					

## RwMEMRYF: Flag chg prev memory prob

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
0.OK					19578	18048	20023	18369	17046	
1.NewR says not ever but pr						24	33	45	32	
2.Says no cur wv but prev s						93	73	55	57	
3.Dispute, set to N									81	
8.Dispute prev wv, but now Y									1	

Value	w11	w12	w13	w14	w15
0.OK					
1.NewR says not ever but pr					
2.Says no cur wv but prev s					
3.Dispute, set to N					
8.Dispute prev wv, but now Y					

## SwMEMRYF: Flag chg prev memory prob

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
.U=Unmarried					6537	6306	6777	6417	6206	
.V=Spouse NR					311	220	380	317	365	
0.OK					12730	11580	12929	11689	10564	
1.NewR says not ever but pr						6	7	22	12	
2.Says no cur wv but prev s						53	36	24	28	
3.Dispute,set to N									42	

Value	w11	w12	w13	w14	w15
.U=Unmarried					
.V=Spouse NR					
0.OK					
1.NewR says not ever but pr					
2.Says no cur wv but prev s					
3.Dispute,set to N					

## RwALZHE: R reports Alzheimer this wv

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
.D=DK										24
.J=Web interview, missing										
.M=Oth missing										
.R=RF										2
0.No										21645
1.Yes										343
3.Disp prev record and has										
4.Disp prev record and no c										
7.Not Alzheimer's disease										20

Value	w11	w12	w13	w14	w15
.D=DK	14	15	15	11	6

## How Constructed

RwMEMORY indicates the raw response to the question regarding whether or not a doctor has told the Respondent they had a memory-related disease. The exact question wording depends on whether this is a first interview and whether the person being interviewed is the same as in the prior interview. If a preload variable indicates that the condition was reported at a prior interview, then the question is skipped. The question about memory-related disease is first asked in Wave 4. It is not asked after Wave 9.

RwMEMORYE is an indicator variable denoting whether or not the Respondent reports a doctor has ever told them that they had this condition in this or any previous wave. Notably, if a Respondent reports they don't know or refuses to answer, the Respondent is also coded as "0." RAMEMRYEF is a flag variable which give the first time, if ever, the Respondent gives a response of "Don't Know," refused to answer the question or was inadvertently skipped over the question.

RwMEMORYQ indicates the question wording used, based on preload variables, and whether the preloaded information is correct. RwMEMORYF indicates whether the current wave conflicts with information given at a prior wave.

The question wording is one of the following (main codes in "Q" variables are given in parentheses):

If new interview, or from Wave 6 forward, new person answering questions (1.NewIvw or 5.ReIvw/NewR): "Has a doctor ever told you that you have ..."

If reinterview and no prior report of condition (2.ReIvw,NoCond): "Since we last talked to you, that is since [last interview date], has a doctor told you that you have ..."

Through Wave 8, if it is a reinterview and the condition is reported in a prior wave (4.ReIvw,Cond), the question is skipped.

In Wave 9, all Respondents were asked this question and were given the opportunity to dispute answers given in previous waves.

In Wave 10, the health questionnaire changed. Respondents are now asked if they have ever been told they have Alzheimer's disease or dementia rather than memory-related disease as in previous waves.

RwALZHE and RwDEMEN indicate the raw response to the questions regarding whether or not a doctor has told the Respondent they had Alzheimer/dementia. The exact question wording depends on whether this is a first interview and whether the person being interviewed is the same as in the prior interview.

RwALZHEE and RwDEMENE are indicator variables denoting whether or not the Respondent reports a doctor has ever told them that they had this condition in this or any previous wave. Notably, if a Respondent reports they don't know or refuses to answer, the Respondent is also coded as "0." RAALZHEEF and RADEMENEF are flag variables which give the first time, if ever, the Respondent gives a response of "Don't Know," refused to answer the question or was inadvertently skipped over the question.

RwALZHEF and RwDEMENF indicate whether the current wave conflicts with information given at a prior wave. RwALZHEQ and RwDEMENQ indicate the question wording used, based on preload variables, and whether the preloaded information is correct.

The question wording is one of the following (main codes in "Q" variables are given in parentheses):

If new interview, or from Wave 6 forward, new person answering questions (1.NewIvw or 5.ReIvw/NewR): "Has a doctor ever told you that you have ..."

If reinterview and no prior report of condition (2.ReIvw,NoCond): "Since we last talked to you, that is since [last interview date], has a doctor told you that you have ..."

The "Q" variables have additional codes that indicate situations where the preload variables determine the question wording, but do not agree with the actual situation in prior waves. A code of 11 means that the Respondent has a prior interview but the preload indicates this is a new interview, so the question asks if the Respondent has ever been told about a condition; 12 means that this is a new interview but the preload indicates it is a reinterview; and 15 means that the Respondent previously reported having a condition but the preload indicates a prior interview with no condition. In situations flagged by a 12 or 15, the question asks if the Respondent has been told about a condition since the last interview, even though this is the Respondent's first interview (in the case of 12), or the question should have been skipped due to a prior report (in the case of 15). A code of 20 means that the Dementia question was skipped because the Respondent said yes to the Alzheimer's question this wave.

RwMEMORY, RwALZHE, and RwDEMEN are recoded to reflect the answer given. The meaning of the answer depends on the question asked, so the analyst may want to consider this variable in conjunction with the corresponding "Q" variables. Generally, a "1" means "yes" and "0" means "no." For RwMEMORY, note that for a re-interview when the condition was previously reported, this question is skipped; in this situation the variable is set to special missing .Y. From Waves 10 forward, if the Respondent indicates that a doctor has told the Respondent they have Alzheimer's disease, then the question about dementia is skipped and RwDEMEN is set to .S=skip (and RwDEMENE is set to 1 (yes)). If the Respondent responds to the Alzheimer question that it was not Alzheimer's disease then RwALZHE is set to 7=not Alzheimer's disease, RwALZHEE is set to 0 (no), and RwDEMEN is set to 1 (yes). Starting in Wave 14, if a preload variable indicates that the condition was reported at a prior interview, then the question (for RwALZHE and RwDEMEN) is skipped and the values are set to 1 (yes).

SwMEMORY, SwALZHE, SwDEMEN, SwMEMORYQ, SwALZHEQ, SwDEMENQ, SwMEMRYE, SwALZHEE, SwDEMENE, SwMEMRYF SwALZHEF, and SwDEMENF, give this information for the Respondent's spouse or partner.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S4MEMORY is taken from the Wave 4 spouse's R4MEMORY variable.

Please see the "Change in Health" variables as well. Included there are RwMEMRYS, RwALZHES, and RwDEMENS, which measure whether the disease is new in a particular wave, i.e., reported as new since the last interview.

## Cross Wave Differences in Original HRS Data

Respondents are first asked about memory-related disease in Wave 4. At a Respondent's first interview at or after Wave 4, the question asks:

"Has a doctor ever told you that you have a memory-related disease?"

From Wave 6 forward, if the person answering the questions is new, the question is asked as though it were the first interview, regardless of what had been reported at prior interviews. Thus if the prior interview was given by the Respondent and the current is by proxy, or vice versa, or if both interviews are by proxy but conducted with different people, then this is treated like a first interview and the ever question wording is used.

Until Wave 9, the question is not asked if the appropriate preloaded variable indicates that the Respondent has said yes to this condition at a prior interview. If the preload indicates that the Respondent has not yet reported a memory-related disease then the question wording is:

"Since we last talked to you, that is since [last interview date], has a doctor told you that you have a memory-related disease?"

The definition of "doctor" in Wave 6 was: Medical doctors include specialists such as, Dermatologists, Psychiatrists, Ophthalmologists, as well as general practitioners, and Osteopaths. Do not include Chiropractors, Dentists, or Nurses/Nurse Practitioners.

In Wave 7 this was expanded as follows: Medical doctors include specialists such as Dermatologists, Psychiatrists, Ophthalmologists, Osteopaths, Cardiologists, as well as family doctors, internists and physicians' assistants. Do not include Chiropractors, Dentists, or Nurses/Nurse Practitioners.

In Wave 9, all Respondents were asked this question and were given the opportunity to dispute answers given in previous waves.

In Wave 10, the health questionnaire changed. Respondents are now asked if they have ever been told they have Alzheimer's disease or dementia rather than memory-related disease as in previous waves.

## How Constructed

RwHIBPE2, RwDIABE2, RwCANCRE2, RwLUNGE2, RwHEARTE2, RwSTROKE2, RwPSYCHE2, and RwARTHRE2 are dummy variables that indicate a Respondent reports that a doctor has ever told them that they have the specified condition. The conditions are 1) high blood pressure or hypertension; 2) diabetes or high blood sugar; 3) cancer or a malignant tumor of any kind except skin cancer; 4) chronic lung disease except asthma such as chronic bronchitis or emphysema; 5) heart attack, coronary heart disease, angina, congestive heart failure, or other heart problems; 6) stroke or transient ischemic attack (TIA); 7) emotional, nervous, or psychiatric problems; and 8) arthritis or rheumatism.

These sets of "ever had" variables are initially set to "0.No" and are turned on when a Respondent reports "yes" for the first time. Once a Respondent has two consecutive "yes" reports, they will be coded "1.Yes" for all waves going forward and coded "0.No" for all waves prior to the first of the two consecutive "yes" reports.

Missing value answers such as "don't know" and "refused" are ignored in the counting. That is, if a Respondent reports "yes" in Wave 1, "Don't know" in Wave 2, does not participate in Wave 3, and answers "yes" for the second time in Wave 4, then all waves the Respondent participates in will be coded as "1.Yes."

If a Respondent disputes a prior wave after having given two consecutive "yes" reports, their later wave values may conflict with prior waves. Similarly, if a Respondent enters the survey in Wave 4 and reports "yes," then disputes in Wave 5, followed by two "yesses" in Waves 6 and 7, then Waves 4 and 5 would both be assigned "0.No" even though the Respondent initially reported "yes" in Wave 4. For Waves 6 and 7, because there are two consecutive "yesses," the Respondent will be assigned "1.Yes" from Wave 6 forward.

SwHIBPE2, SwDIABE2, SwCANCRE2, SwLUNGE2, SwHEARTE2, SwSTROKE2, and SwARTHRE2 give this information for the Respondent's spouse or partner.

## Cross Wave Differences in Original HRS Data

A series of questions asks the Respondent if a doctor has ever diagnosed them with certain medical conditions. At a Respondent's first interview, Waves 1 and 2A, the question asks: "Has a doctor ever told you that you have ..."

From Wave 6 forward, if the person answering the questions is new, the question is asked as though it were the first interview, regardless of what had been reported at prior interviews. Thus, if the prior interview was given by the Respondent and the current is by proxy (or vice versa), or if both interviews are by proxy but conducted with different people, then this is treated like a first interview and the "ever" question wording is used.

At subsequent interviews, the question wording depends on whether the appropriate preloaded variable indicates that the Respondent has said "yes" to the condition at a prior interview. If not, the question wording is: "Since we last talked to you, that is since [last interview date], has a doctor told you that you have ..."

From Wave 14 forward if it is a reinterview of the same reporter as the previous wave and if the Respondent/reporter reported having had the condition, then a value of "1. Yes" is assigned to the "...has a doctor told you that you have the condition" and the Respondent is skipped to the subsequent question.

There is variation across the waves on whether and which question Respondents are asked if they had previously reported a condition at a prior interview. In Wave 2H, if the preloaded variable indicates that the Respondent reported the condition in Wave 1, no question is asked for most conditions. For heart problems, the above question is asked regardless of the preloaded variable value; if the preloaded variable indicates a Wave 1 heart problem, it is prefaced by a statement that a heart condition has already been reported.

From Wave 3 forward, if the preloaded variable indicates that the Respondent reported a condition at a prior interview, a statement is read: "Our records from your last interview show that you have had ..." No explicit question is asked. If the Respondent disputes the statement voluntarily, this is recorded, but no follow-up on the current diagnosis of the condition is asked in Waves 3 and 4.

From Waves 5 through 13, if the Respondent disputes the statement, the interviewer is instructed to probe as to whether or not the Respondent has since been diagnosed with the condition. The dispute is recorded as "disputes previous wave record but now has the condition" or "disputes and does not have the condition." Most disputes are of the latter type. If the Respondent does not dispute the statement, the variable that indicates the diagnosis of the condition is set to "yes." From Wave 14 forward if it is a reinterview of the same reporter as the previous wave and if the Respondent/reporter reported having had the condition, then a value of "1. Yes" is assigned to the "...has a doctor told you that you have the condition," and the Respondent is skipped to the subsequent question. However, in the subsequent question, the Respondent can dispute having previously had the condition. In these cases, the interviewer overwrites the "Has a doctor told you that you have " with either a value of "4.Never had <condition>" or "6.Had <condition> but do not have it now."

In Wave 4, an alternate variable is provided for the heart condition question (F1156A). A skip pattern problem in this wave causes some cases who had previously reported a heart condition to be asked if they had been told they had one since last interview, and some respond "No." These cases are identified in F1156A.

In Wave 2A and from Wave 3 forward, a code for "possible stroke or transient ischemic attack (TIA)" is added if the Respondent volunteered this information in answer to the question about strokes. This code is not available in Waves 1 and 2H. TIA is treated the same as a "yes" answer in deriving RwSTROKED.

The definition of "doctor" in Wave 6 was: "Medical doctors include specialists such as, Dermatologists, Psychiatrists, Ophthalmologists, as well as general practitioners, and Osteopaths. It does not include Chiropractors, Dentists, or Nurses/Nurse Practitioners." In Wave 7, this was expanded as follows: "Medical doctors include specialists such as Dermatologists, Psychiatrists, Ophthalmologists, Osteopaths, Cardiologists, as well as family doctors, internists and physicians' assistants." From Wave 10 forward, the definition was further expanded to say: "Medical doctors include specialists such as Dermatologists, Psychiatrists, Ophthalmologists, Osteopaths, Cardiologists, as well as family doctors, internists and physicians' assistants. Also include diagnoses made by Nurses and Nurse Practitioners."

## How Constructed

RwMEMRYE2, RwALZHEE2, and RwDEMENE2 are dummy variables that indicate a Respondent reports that a doctor has ever told them that they have the specified condition.

These sets of "ever had" variables are initially set to "0.No" and are turned on when a Respondent reports "yes" for the first time. Once a Respondent has two consecutive "yes" reports, they will be coded "1.Yes" for all waves going forward and coded "0.No" for all waves prior to the first of the two consecutive "yes" reports.

Missing value answers such as "don't know" and "refused" are ignored in the counting. That is, if a Respondent reports "yes" in Wave 10, "Don't know" in Wave 11, does not participate in Wave 12, and answers "yes" for the second time in Wave 13, then all waves the Respondent participates in will be coded as "1.Yes" starting in Wave 10.

If a Respondent disputes a prior wave after having given two consecutive "yes" reports, their later wave values may conflict with prior waves. Similarly, if a Respondent reports "yes" in Wave 10, then disputes in Wave 11, followed by two "yeses" in Waves 12 and 13, then Waves 10 and 11 would both be assigned "0.No" even though Respondent initially reported "yes" in Wave 10. For Waves 12 and 13, because there are two consecutive "yeses," the Respondent will be assigned "1.Yes" from Wave 12 forward.

SwMEMRYE2, SwALZHEE2, and SwDEMENE2 give this information for the Respondent's spouse or partner.

## Cross Wave Differences in Original HRS Data

Respondents are first asked about memory-related disease in Wave 4. At a Respondent's first interview at or after Wave 4, the question asks:

"Has a doctor ever told you that you have a memory-related disease?"

From Wave 6 forward, if the person answering the questions is new, the question is asked as though it were the first interview, regardless of what had been reported at prior interviews. Thus if the prior interview was given by the Respondent and the current is by proxy, or vice versa, or if both interviews are by proxy but conducted with different people, then this is treated like a first interview and the ever question wording is used.

Until Wave 9, the question is not asked if the appropriate preloaded variable indicates that the Respondent has said yes to this condition at a prior interview. If the preload indicates that the Respondent has not yet reported a memory-related disease then the question wording is:

"Since we last talked to you, that is since [last interview date], has a doctor told you that you have a memory-related disease?"

The definition of "doctor" in Wave 6 was: Medical doctors include specialists such as, Dermatologists, Psychiatrists, Ophthalmologists, as well as general practitioners, and Osteopaths. Do not include Chiropractors, Dentists, or Nurses/Nurse Practitioners.

In Wave 7 this was expanded as follows: Medical doctors include specialists such as Dermatologists, Psychiatrists, Ophthalmologists, Osteopaths, Cardiologists, as well as family doctors, internists and physicians' assistants. Do not include Chiropractors, Dentists, or Nurses/Nurse Practitioners.

In Wave 9, all Respondents were asked this question and were given the opportunity to dispute answers given in previous waves.

In Wave 10, the health questionnaire changed. Respondents are now asked if they have ever been told they have Alzheimer's disease or dementia rather than memory-related disease as in previous waves.

## General Comments

RwBMI, RwHEIGHT, and RwWEIGHT are based on self-reported (or proxy-reported) data. Please refer to the "Physical Measures: BMI, Height, Weight, Waist" section for RwPMBMI, RwPMHGHT, and RwPMWGHT, which are based on physically-measured data.

## How Constructed

RwBMI, RwHEIGHT, and RwWEIGHT are the Respondent's body mass index, height, and weight based on self-reported (or proxy-reported) data. SwBMI, SwHEIGHT, and SwWEIGHT are this information for the Respondent's spouse or partner.

BMI is calculated using the weight divided by the square height  $\frac{weight}{height^2}$ .

Height, given in feet and inches, is converted to meters. Weight is converted to kilograms. Height is frequently missing from Wave 3 forward. The Wave 1 or 2 height is used to fill missing heights in later waves.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3BMI is taken from the Wave 3 spouse's R3BMI.

## Cross Wave Differences in Original HRS Data

Questions ask the Respondent's weight in pounds at each wave. The Respondent's height in feet and inches is asked of everyone in Waves 1 and 2H. In Wave 2A, height is asked in inches. From Wave 3 forward, only new interviewees are asked.

## How Constructed

RwBACK indicates whether the Respondent reports back problems. SwBACK is the same information for the Respondent's spouse or partner.

Except in Wave 2, the derivation simply recodes the HRS raw variable for missing values into a yes/no indicator and sets missing values to missing codes. In Wave 2, there is a series of variables that list health problems by code. If any of these variables indicates back problems RwBACK is set to "yes;" if not, it is set to "no."

Note that this question is asked of re-interviewees every other wave from Wave 4 forward. When the question is skipped because it is a re-interview in an alternate year, RwBACK is set to .A, asked in previous wave. For odd numbered waves beginning in Wave 5, the question is asked of everyone.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3BACK is taken from the Wave 3 spouse's R3BACK.

## Cross Wave Differences in Original HRS Data

The wording of this question varies across waves. In Waves 1 and 2H, the question asks:

"Do you have any of the following health problems? Problems with your back?"

In Wave 2A, the question asks:

"Do you have any other major health problems which you haven't told me about?"

Then following are lists of different health problems.

From Wave 3 forward, the question asks:

"[Since we last talked to you in (previous interview month)] Have you had any of the following persistent or troublesome problems? Back pain or problems?"

The answers can be yes or no in all waves. In all waves except Wave 2, the answers are coded in a single variable for back problems. In Wave 2, the answers are given in a series of variables that code which health problems the Respondent reported. The code for back problems is 2 in Wave 2H and 112 in Wave 2A.

In every other wave beginning with Wave 4, only new Respondents are asked the question. In these waves (even-numbered waves from Wave 4 forward), it is skipped for re-interviewees. In the other waves (odd-numbered waves from Wave 5 forward), the question is asked of everyone.

0.No	9025	12322
1.Yes	875	737

### How Constructed

RwULCER indicates whether the Respondent reports any stomach or intestinal ulcers. SwULCER is the same information for the Respondent's spouse or partner.

The Wave 1 derivation simply recodes the HRS raw variable for missing values into a yes/no indicator and sets missing values to missing codes. In Wave 2, there is a series of variables that list health problems by code. If any of these variables indicates stomach or intestinal ulcers RwULCER is set to "yes;" if not, it is set to "no."

The question is not asked after Wave 2.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S2ULCER is taken from the Wave 2 spouse's R2ULCER.

### Cross Wave Differences in Original HRS Data

The question about ulcers is asked only in Waves 1 and 2:

In Waves 1 and 2H, the question asks:

"Do you have any of the following health problems? Stomach or intestinal ulcers?"

In waves 2A, the question asks:

"Do you have any other major health problems which you haven't told me about?"

Then following are lists of health problems.

The answers can be "yes" or "no" in these waves. In Wave 1 the answers are coded in a single variable for ulcers. In Wave 2, the answers are given in a series of variables that code which health problems the Respondent reported. The code for ulcers is 5 in Wave 2H, and 151 in Wave 2A.

## How Constructed

R1LTACTF gives the Respondent's frequency of light physical activity or exercise. R1VGACTF gives the Respondent's frequency of vigorous physical activity, and R1HSWRKF gives the frequency of doing heavy housework. R2LTACTN and R2LTACTP give the Respondent's frequency of light physical activity as number of times and over what period, respectively. R2VGACTN and R2VGACTP give the same for the Respondent's frequency of vigorous physical activity. RwLHTACT and RwVIGACT indicate whether the Respondent participates in light and vigorous physical activity, respectively, 3 or more times a week.

S1LTACTF, S1VGACTF, S1HSWRKF, S2LTACTN, S2LTACTP, S2VGACTN, S2VGACTP, SwLHTACT, and SwVIGACT give this information for the Respondent's spouse or partner.

In Wave 2A, questions are not asked about either light or vigorous activity. For AHEAD Respondents in Wave 2, R2VIGACT, R2VGACTF, R2HSWRKF, R2VGACTN, R2VGACTP, R2LHTACT, R2LTACTF, R2LTACTN AND R2LTACTP are set to the .Q SAS special missing value, to indicate that no information is available.

The raw categorical Wave 1 variables are simply recoded for missings in R1LTACTF, R1VGACTF, and R1HSWRKF. The raw Wave 2H variables are recoded for missings with R2LTACTN and R2VGACTN set to number of times and R2LTACTP and R2VGACTP set to the period. For R2LTACTN/S2LTACTN, there is a code in the raw HRS data for "All the time; All day at work." For R2VGACTN/S2VGACTN, there is a similar code in the raw HRS data for "Job requires vigorous activity." Both of these designations are recoded to the .L SAS special missing value.

R1LHTACT, R2LHTACT, R1VIGACT, and R2VIGACT are attempts to make Wave 1 and 2H variables that are compatible with yes/no answers for physical activity in later waves which ask if the Respondent participates in vigorous activity 3 or more times per week. For Wave 1, the derivation sets R1LHTACT to "yes" if R1LTACTF is 3+ times a week, and to "no" otherwise. The derivation for R1VIGACT combines the vigorous activity and heavy housework questions. If either is 3+ times/week, then R1VIGACT is set to "yes."

In Wave 2H, the derivation sets R2LHTACT based on the number of times and frequencies to arrive at a yes/no answer for 3+ times per week. It is made "yes" if the period is day, or if the Respondent answers 3+ times per week, 12+ times per month, or 156+ times a year. The derivation for R2VIGACT is the same.

From Wave 3 to Wave 6, the RwVIGACT derivation recodes the raw variable to "1" if the Respondent answers "yes," participates in vigorous physical activity 3 or more times a week, and to "0" for "no." The question about light physical activity is not asked.

From Wave 7 forward, the single question about vigorous physical activity is replaced with three questions about physical activity, which offer the choice of vigorous, moderate or light physical activity occurring every day, more than once per week, once per week, one to three times per month, or never. These measures are derived as RwVGACTX, RwMDACTX, RwLTACTX, SwVGACTX, SwMDACTX and SwLTACTX.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S2VIGACT is taken from the Wave 2 spouse's R2VIGACT variable.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, three questions ask about light physical activity, vigorous physical activity, and doing heavy housework:

"The next few questions are about exercise. How often do you participate in light physical activity—such as walking, dancing, gardening, golfing, bowling, etc?"

"How often do you participate in vigorous physical exercise or sports—such as aerobics, running, swimming, or bicycling?"

"How often do you do heavy housework like scrubbing floors or washing windows?"

The answers are 5-category frequencies: 3+ times/week, 1-2 times/week, 1-2 times/month, less than 1/month, and never.

In Wave 2H, the question wording about light physical activity is similar but the question about vigorous physical activity includes doing heavy housework and both questions are answered in two parts:

"The next few questions are about physical activities. Please tell me how often you participate in light physical activity—such as walking, dancing, gardening, golfing, bowling, etc?"

"How often do you participate in vigorous physical activity or sports—such as heavy housework, aerobics, running, swimming, or bicycling?"

The answers are given as how many times and over what period.

In Wave 2A, the questions are not asked.

From Waves 3 through 6, the question about light physical activity is not asked. The only question about physical activity asks:

"On average over the last 12 months have you participated in vigorous physical activity or exercise three times a week or more? By vigorous physical activity, we mean things like sports, heavy housework, or a job that involves physical labor."

The answers are given as "yes" or "no," for 3 or more times per week.

Because of wording differences, even with the attempt to recode to a consistent measure, the RwVIGACT variables seem to be significantly different measures across waves. In Waves 1 and 2H, the questions asking about vigorous physical activity do not specify including a job that involves physical labor. Whereas in Waves 3 through 6, the question about vigorous physical activity includes sports, heavy housework, and a job that involves physical labor. No questions are asked about light or vigorous activity in Wave 2A.

From Wave 7 forward, the single question about vigorous physical activity is replaced with three questions covering vigorous, moderate or light physical activity. The possible responses also change to: every day, more than once per week, once per week, one to three times per month, or never. The wording for these questions is:

"We would like to know the type and amount of physical activity involved in your daily life. How often do you take part in sports or activities that are vigorous, such as running or jogging, swimming, cycling, aerobics or gym workout, tennis, or digging with a spade or shovel?"

"And how often do you take part in sports or activities that are moderately energetic such as, gardening, cleaning the car, walking at a moderate pace, dancing, floor or stretching exercises?"

"And how often do you take part in sports or activities that are mildly energetic, such as vacuuming, laundry, home repairs?"

## How Constructed

The RwDRINK variables indicate whether the Respondent ever drinks alcoholic beverages. The R1DRINKR, R2DRINKR, RwDRINKD, and RwDRINKN variables are the Respondent's answers to how often they drink alcoholic beverages.

The SwDRINK, S1DRINKR, S2DRINKR, SwDRINKD, and SwDRINKN variables give this information for the Respondent's spouse or partner.

The drinking behavior variables are simply recoded from the raw HRS variables. In Wave 3 for R3DRINKN, there is a code in the original HRS data for "drinks all day," and this is recoded to 99. There are different variables for how often the Respondent drinks in Waves 1 and 2 than in subsequent waves, because different follow-up questions are asked. If the Respondent says they never drink alcohol, the "how often" variables are set to zero.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S2DRINK is taken from the Wave 2 spouse's R2DRINK variable.

## Cross Wave Differences in Original HRS Data

In Waves 1 and 2, a question asks: "Do you ever drink any alcoholic beverages, such as beer, wine, or liquor?" If yes, another question asks for a range of drinks per day in general. The possible answers are: less than 1, 1-2, 3-4, 5 or more.

From Wave 3 forward, the same initial question asks if the Respondent ever drinks alcoholic beverages. If yes, two follow-up

questions are asked about the last 3 months:

"In the last three months, on average, how many days per week have you had any alcohol to drink? (For example, beer, wine, or any drink containing liquor.)"

"In the last three months, on the days you drink, about how many drinks do you have?"

If the answer to the first follow-up question is none or less than once week, then the second follow-up question is skipped.

## How Constructed

RwCHOLST, RwFLUSHT, RwBREAST, RwMAMMOG, RwPAPSM, and RwPROST indicate whether the Respondent reports preventative health tests and procedures. The tests and procedures are a blood test for cholesterol, a flu shot, monthly self-checks for breast lumps, a mammogram, a pap smear, and a check for prostate cancer, respectively. They are asked from Wave 3 forward.

SwCHOLST, SwFLUSHT, SwBREAST, SwMAMMOG, SwPAPSM, and SwPROST are these measures for the Respondent's spouse or partner.

Every other wave beginning in Waves 4 and 6, these questions are skipped for individuals who responded to a previous wave. The analyst may want to carry prior wave values forward, e.g., Wave 3 values forward to Wave 4; this file does not do this. For re-interviewees who skipped this question in alternate waves, these variables are set to .A, asked in previous wave. In the odd waves, beginning with Wave 5, all individuals are asked these questions.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3BREAST is taken from the Wave 3 spouse's R3BREAST.

## Cross Wave Differences in Original HRS Data

The preventative behavior questions are asked from Wave 3 forward. They are not asked in Waves 1 and 2.

Every other wave, beginning with Wave 4, these questions are asked only of new Respondents. For re-interviewees, they are skipped. In the odd waves, beginning with Wave 5, all individuals are asked these questions.

From Wave 7 forward, the interviewer has an additional prompt for the Respondent when asking about flu shots: A FLU SHOT MAY NOW BE GIVEN BY A MIST IN THE NOSE. And the interviewer has additional instructions for coding answers about breast exams: CODE 'YES' IF RESPONDENT DOES A BREAST CHECK MORE THAN ONCE A MONTH.

The question about monthly breast checks is dropped in Wave 11 so RwBREAST is not available beyond Wave 10.

Only male Respondents are asked the question about checking for prostate cancer. Only female Respondents are asked the questions about breast exams, mammograms, and pap smears.

## How Constructed

RwSMOKEV indicates whether the Respondent ever smoked cigarettes. RwSMOKEN indicates whether the Respondent smokes now. SwSMOKEV and SwSMOKEN are this information for the Respondent's spouse or partner.

These variables are recoded for missings into yes/no indicators. Since the ever-smoked question is usually only asked at the Respondent's first interview, the answer is carried forward for RwSMOKEV in subsequent waves. If at any wave a Respondent says they currently smoke cigarettes, i.e., RwSMOKEN is yes, RwSMOKEV is set to yes in that and all subsequent waves.

Until Wave 7, Respondents were asked if they smoke now regardless of whether they'd ever smoked. From Wave 7 forward, both the ever and now smoking questions are usually skipped if the Respondent had previously stated that they had never smoked. If the questions were skipped for this reason, RwSMOKEV and RwSMOKEN are set to "0. No". We verified this assumption by observing

that Respondents who had never smoked in an earlier wave rarely respond "yes" to smoking cigarettes in a subsequent wave.

The spouse variables are taken from the Wave 'w' spouse's self-reported information, e.g., S3SMOKEN is taken from the Wave 3 spouse's R3SMOKEN.

## Cross Wave Differences in Original HRS Data

In Wave 1 all Respondents are asked: "Have you ever smoked cigarettes?"

This question is not asked in Waves 2H and 3. From Wave 4 forward, it is asked of new interviewees.

In Wave 2A question asks: "How would you describe yourself; as a current smoker, as a former smoker, or as someone who has never smoked?"

In all waves, except Wave 2A, a question asks: "Do you smoke cigarettes now?"

The answers to these questions are "yes" and "no." In some waves, cigars or pipes are given as coded answers.

In Waves 2H and 3A, this question is asked of everyone. In Wave 3H, this question is usually skipped if the Respondent said "no" to having ever smoked in a previous wave. In Waves 4 to 6, the question is usually skipped if a new interviewee said no to the ever smoked question. It is asked of all new interviewees who ever smoked and all re-interviewees.

From Wave 7 forward, both the ever and now smoking questions are usually skipped if the Respondent had previously stated that they had never smoked.

## How Constructed

The change in health measures were chosen for their consistency across waves. They include measures of overall health, functional limitation summaries, doctor-diagnosed health conditions, and assessment of mortality measures.

They are calculated as the current wave less the previous interview measures. If the Respondent missed an interview due to non-response, the change is between the current and the last interview that the Respondent did respond to. A flag for each change variable indicates how many interviews were missed prior to the current.

For further discussion of the Change in Health variables, see the section titled "Health Change" earlier in this document.

RwSHLTC is the change in self-reported health status from the previous to the current interview. RwSHLTCF indicates how far back the previous interview is. SwSHLTC and SwSHLTCF are this information for the Respondent's spouse or partner.

The derivation of RwSHLTC is:

$$\text{RwSHLTC} = \text{RwSHLT} - \text{RpSHLT}$$

Where "w" means current wave and "p" means the previous interview. For example, if an individual responded to Waves 2 and 3,  $\text{R3SHLTC} = \text{R3SHLT} - \text{R2SHLT}$ . Since a lower number means better health in the RwSHLT variables, a positive value for RwSHLTC indicates a decline in self-rated health.

Not all individuals respond to every interview. Respondents may miss one or more interviews between those they complete. RWSHLTCF indicates if there are any missed interviews prior to the current, and if so, how many. In other words, it indicates how far back the previous interview is, from which the change is measured. For example, a value of zero (0) indicates the Respondent did not miss the previous interview and  $\text{change} = \text{current} - [\text{current}-1]$ ; a value of one (1) indicates the Respondent missed the previous interview, but only one and  $\text{change} = \text{current} - [\text{current}-2]$ ; a value of two (2) indicates the Respondent missed the two previous interviews and  $\text{change} = \text{current} - [\text{current}-3]$ ; et cetera. If this is the Respondent's first interview, then RWSHLTC and RWSHLTCF are set to .P to indicate no previous interview.

Please see also the self-reported change in health variable RWHLTC described earlier in this section, and the description of the self-reported health variable RWSHLT. Note that RWHLTC asks the Respondent to assess retrospectively how their health has changed since the last interview, while RWSHLTC compares measures of self-reported current health from the two time points.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3SHLTC is taken from the Wave 3 spouse's R3SHLTC.

### **Cross Wave Differences in Original HRS Data**

Please see the documentation of the variables used to derive these change-in-health variables for a description of cross-wave differences in the raw HRS data.

<b>Change in Health: Conditions</b>
-------------------------------------

## How Constructed

The change in health measures were chosen for their consistency across waves. They include measures of overall health, functional limitation summaries, doctor-diagnosed health conditions, and assessment of mortality measures.

They are calculated as the current wave less the previous interview measures. If the Respondent missed an interview due to non-response, the change is between the current and the last interview that the Respondent did respond to. A flag for each change variable indicates how many interviews were missed prior to the current.

For further discussion of the Change in Health variables see the section titled "Health Change" earlier in this document.

RwHIBPS, RwDIABS, RWCANCRS, RwlUNGS, RwhEARTS, RwSTROKS, RwPSYCHS, RwARTHRS, and RwsLEEPS indicate if the Respondent has reported the onset of a condition since the last interview to which they responded. They are set to "yes" only if the condition is new since last interview, that is, the Respondent reported not having the condition at the last interview but says they have it now. If this is the Respondent's first interview, then these variables are set to .P to indicate no previous interview.

RwCONDS is the count of the new individual conditions. RwCONDSP counts the number of values that were changed due to disputes. RwCONDSP tells which prior interview was used. These variables only include the eight original "ever had" conditions as RwsLEEPS was first asked in Wave 13.

SwHIBPS, SwDIABS, SwCANCRS, SwLUNGS, SwHEARTS, SwSTROKS, SwPSYCHS, SwARTHRS, SwCONDS, SwCONDSP, SwCONDSP, and SLEEPS are this information for the Respondent's spouse or partner.

Not all individuals respond to every interview. Respondents may miss one or more interviews between those they complete. RwCONDSP indicates if there are any missed interviews prior to the current, and if so, how many. In other words, it indicates how far back the previous interview is, from which the change is measured. For example, a value of zero (0) indicates the Respondent did not miss the previous interview and change = current - [current-1]; a value of one (1) indicates the Respondent missed the previous interview, but only one and change = current - [current-2]; a value of two (2) indicates the Respondent missed the two previous interviews and change = current - [current-3]; et cetera. If this is the Respondent's first interview, then RwCONDS and RwCONDSP are set to .P to indicate no previous interview.

Please see the section on "Doctor-diagnosed Conditions" earlier in this section for a description of related "ever had" variables, the raw HRS variables, and cross-wave differences.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S3CONDS is taken from the Wave 3 spouse's R3CONDS.

## Cross Wave Differences in Original HRS Data

Please see the documentation of the variables used to derive these change-in-health variables for a description of cross-wave differences in the raw HRS data.

## How Constructed

The change in health measures were chosen for their consistency across waves. They include measures of overall health, functional limitation summaries, doctor-diagnosed health conditions, and assessment of mortality measures.

They are calculated as the current wave less the previous interview measures. If the Respondent missed an interview due to non-response, the change is between the current and the last interview that the Respondent did respond to. A flag for each change variable indicates how many interviews were missed prior to the current.

For further discussion of the Change in Health variables see the section titled "Health Change" earlier in this document.

In Wave 10, the health questionnaire changed. Respondents are now asked if they have ever been told they have Alzheimer's disease or dementia rather than memory-related disease as in previous waves.

RwMEMRYS indicates if the Respondent has reported the onset of a memory-related disease since the last interview to which they responded. RwALZHES indicates if the Respondent has reported the onset of a Alzheimer's disease since the last interview to which they responded. RwDEMENS indicates if the Respondent has reported the onset of dementia since the last interview to which they responded. The variables are set to "yes" only if the condition is new since last interview, that is, the Respondent reported not having the condition at the last interview but says they have it now. If this is the Respondent's first interview, then these variables are set to .P to indicate no previous interview.

RwMEMRYS, RwALZHES, and RwDEMENS are included with the Change in Health variables along with those for other doctor-diagnosed health conditions, but is NOT included in the sum of those, i.e., RwCONDS. The question about memory-related disease is first asked in Wave 4, so RwMEMRYS begins in Wave 5. The questions about Alzheimer's and dementia begin in Wave 10, so RwALZHES and RwDEMENS begin in Wave 11.

SwMEMRYS, SwALZHES, and SwDEMENS are the information for the Respondent's spouse. It is taken from the Wave "w" spouse's self-reported information, e.g., S5MEMRYS is taken from the Wave 5 spouse's R5MEMRYS.

Please see the section on "Doctor-diagnosed Conditions: Memory-related disease" earlier in this section for a description of related "ever had" variables, the raw HRS variables, and cross-wave differences.

### **Cross Wave Differences in Original HRS Data**

Please see the documentation of the variables used to derive this change-in-health variable for a description of cross-wave differences in the raw HRS data.

### General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are

separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

From the HRS documentation: "Number Series measures quantitative reasoning, a specific type of fluid cognitive ability or fluid intelligence. Quantitative reasoning ability involves reasoning with concepts that depend upon mathematical relationships. The number series task requires the Respondent to look at a series of numbers with a number missing from the series. The Respondent must determine the numerical pattern, and then provide the missing number in the series.

The HRS Number Series task is a 6-item block-adaptive test. "Block-adaptive" refers to the skip pattern among the items during test administration. The Number Series is based on two lists of 15 items. The 15 items are grouped into five sets or "blocks" of three items, grouped by item difficulty level. Item difficulty level refers to the probability that a Respondent will answer the item correctly. All Respondents are asked the same first three items, which consist of an easier item, a moderately difficult item, and a more difficult item. Based on the number of items answered correctly in the first block of three items, Respondents are then asked one of 4 remaining sets of three items: the easiest set, a somewhat easy set, a more difficult set, or a most difficult set. A score for the second set is then calculated.

The total score, RwnSSCRE, is a calculated score that takes into account which blocks of items were asked (i.e., the difficulty level of the items presented in terms of the probability that a Respondent will answer correctly) and the number of items answered correctly in each block. This calculated score is a standardized score called a W-score, comparable to the W-scores in the Woodcock-Johnson III (WJIII) test battery on which this task was based. The W-score metric was developed by scaling to a mean of 500 in the WJIII norming sample. Higher scores indicate better performance on the number series task. RwnSSCSE is the standard error of the number series score. The value indicates the measurement precision of the total score."

These variables are only available in Wave 10 and odd numbered waves beginning in Wave 11. It is only available for final release data. RwnSSCRE is taken directly from the HRS variables [x]NSSCORE, where "x" is the wave-specific letter prefix, and RwnSSCSE is taken directly from the HRS variables [x]NSSCORESE, where "x" is the wave-specific letter prefix.

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web

interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

These variables indicate whether and/or which cognitive functioning measures are provided. `RwSTATUS` indicates the overall status; `RwFLAG` indicates the interview year that applies for Waves 2-3; `RwNOTICS` flags cases not asked the TICS questions from Wave 4 forward; and `RwNOVOC` flags cases not asked the vocabulary questions from Wave 7 forward. `RwCOGMODE` indicates interview mode for cognition section and is available from Wave 14 forward.

`RwSTATUS` has a value of "1" if cognition measures are provided, "2" if they are not because the interview was by proxy, and "3" if they are not because the Respondent did not respond. Special missings have been assigned when the Respondent did not appear in the imputation file from HRS, as follows: `.X` if there is no non-proxy interview across all waves, and `.C` if missing because the Respondent is an HRS-AHEAD overlap case. Except for Wave 1, a `.C` in `RwSTATUS` indicates HRS-AHEAD overlap cases that had a non-proxy interview in Wave 1, but never responded in AHEAD.

In Wave 1, HRS-AHEAD overlap cases are treated as non-responders in that wave in the imputation file. For these cases, if there is no non-proxy interview including Wave 1, we set `R1STATUS` to `.X`. Otherwise, `R1STATUS` is set to `.C`.

`R2FLAG` has values of 93 or 94, and `R3FLAG` has values of 95 or 96. These indicate the interview years that were used to derive the measures. 93/95 include members of the AHEAD cohort, while 94/96 include members of the HRS cohort.

From Wave 4 forward, Respondents 65 and older who had a prior interview skipped the date, object, and President/Vice-president naming and vocabulary tasks. `RwNOTICS` is set to "1" if the Respondent skipped these tasks based on age and re-interview status, and "0" if the Respondent was asked to perform them.

From Wave 7 to Wave 11, the vocabulary questions are skipped in odd waves (Waves 7,9, and 11) for individuals who responded to a previous wave. From Wave 12 forward, the vocabulary questions are only asked to new Respondents. `RwNOVOC` is set to "1" if the Respondent skipped the vocabulary questions based on age, re-interview status, and alternate year settings, and "0" if the Respondent was asked to perform the vocabulary task.

From Wave 14 forward, Respondents can respond to the cognition section (and other sections) of the interview via Web. If the Respondent's interview is Web mode, some of the cognition variables were implemented, measured, or conducted differently. `RwCOGMODE` indicates the interview mode for the cognition section. See the HRS documentation linked in the General Comments section for more information.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (`.X`), the specific interview was by proxy (`.S`), cognition measure not asked (reinterview/lt 65) (`.N`), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (`.C`). In these cases, imputations were not done.

The `SwSTATUS`, `SwFLAG`, `SwNOTICS`, `SwNOVOC`, and `SwCOGMODE` variables were taken from the respective `Rw` variables for the Wave "w" spouse.

Note that the variable names `RwNOTICS` and `RwNOVOC` have been shortened from `RwNOTASKTICS` and `RwNOTASKVOC` in the original HRS imputation file to conform to the current 8-character limit.

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

RwSLFMEM provides self-reported general rating of memory, and RwpSTMEM provides a self-reported measure of change in memory since the last interview or over the last two years.

RwSLFMEM ranges from 1 for excellent to 5 for poor memory. RwpSTMEM ranges from 1 for better to 3 for worse.

RwFSLFME and RwpSTME indicate whether the values were imputed (=1) or not (=0).

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done.

SwSLFMEM, SwFSLFME, SwPSTMEM, and SwFPSTME are taken from the Wave "w" spouse's value for RwSLFMEM,

RwFSLFME, RwpSTMEM, and RwpSTME, respectively.

Note that the variable names RwFSLFME and RwpSTME have been shortened from RwFSLFMEM and RwpSTMEM in the original HRS imputation file to conform to the current 8-character limit.

### **Cross Wave Differences in Original HRS Data**

In Waves 1 and 2H, the questions used for current memory and comparison to the past asked:

"How would you rate your ability to think quickly at the present time?"

And: "Compared with 2 years ago, how would you rate your ability to think quickly? Would you say it is much better now, somewhat better, about the same, somewhat worse, or much worse than it was then?"

In all other waves the wording was different, i.e.:

"How would you rate your memory at the present time?"

And: "Compared with (previous wave interview/two years ago), would you say your memory is better now, about the same, or worse than it was then?"

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

R1IMRC20, R2AIMR10, R2HIMR20, RwIMRC, RwIMRCP, and RwIMRCW provide measures for immediate word recall. They are counts of the number of words from a 10 or 20 word list that were recalled correctly.

In Waves 1 and 2H, the word list contained 20 nouns, which could be recalled in any order. In other waves, the list contained 10 words and Respondents were randomly assigned one of four lists, with a different assignment over four interviews and no overlap with the spouse. The variables R1IMRC20, R2HIMR20, and R2AIMR10 are named to indicate this difference in the measures for Waves 1 and 2.

In Waves 14 forward, these tests were conducted differently depending on if the Respondent had a Face-to-Face/Telephone interview or a Web interview. To account for these differences, RwIMRC is separated into two variables: RwIMRCP for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwIMRCW for Respondents who performed the cognition measures during a Web interview.

RwFIMRC, RwFIMRCP, and RwFIMRCW indicate whether the value was imputed (=1) or not (=0). RwFIMRC is similarly separated into RwFIMRCP and RwFIMRCW for Waves 14 forward.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done. In Waves 14 forward, RwIMRCP and RwFIMRCP are set to .W to indicate a Web interview and RwIMRCW and RwFIMRCW are set to .P to indicate a Face-to-Face/Telephone interview. In these cases, when RwIMRCP and RwFIMRCP are set to .W the the cognition values are in RwIMRCW and RwFIMRCW and when RwIMRCW and RwFIMRCW are set to .P the cognition values are in RwIMRCP and RwFIMRCP.

The Sw immediate word recall variables were taken from the respective Rw variables for the Wave "w" spouse.

Note that the variable names R2AIMR10 and R2HIMR20 have been shortened from R2AIMRC10 and R2HIMRC20 in the original HRS imputation file to conform to the current 8-character limit.

## Cross Wave Differences in Original HRS Data

In Waves 1 and 2H, the word list contained 20 nouns while in other waves 10 nouns were listed. Also in waves other than 1 and 2H, Respondents were randomly assigned one of four non-overlapping lists, with a different list assignment over four interviews. In couple households, each spouse was assigned a different list.

In Waves 14 forward, RwIMRC is separated into two variables: RwIMRCP for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwIMRCW for Respondents who performed the cognition measures during a Web interview. RwFIMRC is similarly separated into RwFIMRCP and RwFIMRCW for Waves 14 forward. See the General Comments and How Constructed sections above for more information.

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

R1DLRC20, R2ADLR10, R2HDLR20, RwDLRC, RwDLRCP, and RwDLRCW provide measures for delayed word recall. They are counts of the number of words from the 10 or 20 word immediate recall list that were recalled correctly after a delay of about 5 minutes spent answering other survey questions.

In Waves 1 and 2H, the word list contained 20 nouns, which could be recalled in any order. In other waves, the list contained 10 words and Respondents were randomly assigned one of four lists, with a different assignment over four interviews and no overlap with the spouse. The variables R1DLRC20, R2HDLR20, and R2ADLR10 are named to indicate this difference in the measures for Waves 1 and 2.

In Waves 14 forward, these tests were conducted differently depending on if the Respondent had a Face-to-Face/Telephone interview or a Web interview. To account for these differences, RwDLRC is separated into two variables: RwDLRCP for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwDLRCW for Respondents who performed the cognition measures during a Web interview.

RwFDLRC, RwFDLRCW, and RwFDLRCW indicate whether the value was imputed (=1) or not (=0). RwFDLRC is similarly separated into RwFDLRCW and RwFDLRCW for Waves 14 forward.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done. In Waves 14 forward, RwDLRCP and RwFDLRCW are set to .W to indicate a Web interview and RwDLRCW and RwFDLRCW are set to .P to indicate a Face-to-Face/Telephone interview. In these cases, when RwDLRCP and RwFDLRCW are set to .W the cognition values are in RwDLRCW and RwFDLRCW and when RwDLRCW and RwFDLRCW are set to .P the cognition values are in RwDLRCP and RwFDLRCW.

The Sw delayed word recall variables were taken from the respective Rw variables for the Wave "w" spouse.

Note that the variable names R2ADLR10 and R2HDLR20 have been shortened from R2ADLRC10 and R2HDLRC20 in the original HRS imputation file to conform to the current 8-character limit.

## Cross Wave Differences in Original HRS Data

In Waves 1 and 2H, the word list contained 20 nouns while in other waves 10 nouns were listed. Also in waves other than 1 and 2H, Respondents were randomly assigned one of four non-overlapping lists, with a different list assignment over four interviews. In couple households, each spouse was assigned a different list.

In Waves 14 forward, RwDLRC is separated into two variables: RwDLRCP for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwDLRCW for Respondents who performed the cognition measures during a Web interview. RwFDLRC is similarly separated into RwFDLRCW and RwFDLRCW for Waves 14 forward. See the General Comments and How Constructed sections above for more information.

The questions asked during the five minute period between immediate and delayed word recall tasks varied across waves. Please see the HRS documentation (linked in the General Comments section above) for a more complete description of the differences.

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

RwSER7, RwSER7P, and RwSER7W provide the number of correct subtractions in the serial 7s test. This test asks the individual to subtract 7 from the prior number, beginning with 100 for five trials. Correct subtractions are based on the prior number given, so that even if one subtraction is incorrect subsequent trials are evaluated on the given (perhaps wrong) answer. Valid scores are 0-5.

In Waves 14 forward, these tests were conducted differently depending on if the Respondent had a Face-to-Face/Telephone interview or a Web interview. To account for these differences, RwSER7 is separated into two variables: RwSER7P for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwSER7W for Respondents who performed the cognition measures during a Web interview.

RwFSER7, RwFSER7P, and RwFSER7W indicate whether the value was imputed (=1) or not (=0). RwFSER7 is similarly separated into RwFSER7P and RwFSER7W for Waves 14 forward.

This task was not given to anyone in Waves 1 and 2H. In Wave 2H, R2SER7 and R2FSER7 are set to special missing .Q to indicate that it is missing for all HRS Respondents.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done. In Waves 14 forward, RwSER7P and RwFSER7P are set to .W to indicate a Web interview and RwSER7W and RwFSER7W are set to .P to indicate a Face-to-Face/Telephone interview. In these cases, when RwSER7P and RwFSER7P are set to .W the the cognition values are in RwSER7W and RwFSER7W and when RwSER7W and RwFSER7W are set to .P the cognition values are in RwSER7P and RwFSER7P.

The Sw serial 7s test variables were taken from the respective Rw variables for the Wave "w" spouse.

## Cross Wave Differences in Original HRS Data

This question was not asked in Waves 1 and 2H.

In Waves 14 forward, RwSER7 is separated into two variables: RwSER7P for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwSER7W for Respondents who performed the cognition measures during a Web interview. RwFSER7 is similarly separated into RwFSER7P and RwFSER7W for Waves 14 forward. See the General Comments and How Constructed sections above for more information.

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

RwBWC20, RwBWC20P, RwBWC20W, and RwBWC86 indicate whether the Respondent was able to successfully count backwards for 10 continuous numbers from 20 and 86, respectively. Two points are given if successful on the first try, one if successful on the second, and zero if not successful on either try.

RwFBWC20, RwFBWC20P, RwFBWC20W, and RwFBWC86 indicate whether the values were imputed (=1) or not (=0).

RwBWC20 is available in Wave 2A and from Wave 3 to Wave 13. RwBWC20P and RwBWC20W are available from Wave 14 forward. Counting backwards from 86 was tested in Wave 3H and Waves 4 to 6. No test was included in Waves 1 and 2H. In Wave 2H, R2BWC20 and R2FBWC20 are set to special missing .Q to indicate that it is missing for all HRS Respondents.

In Waves 14 forward, these tests were conducted differently depending on if the Respondent had a Face-to-Face/Telephone interview or a Web interview. To account for these differences, RwBWC20 is separated into two variables: RwBWC20P for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwBWC20W for Respondents who performed the cognition measures during a Web interview. RwFBWC20 is similarly separated into RwFBWC20P and RwFBWC20W for Waves 14 forward.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done. In Waves 14 forward, RwBWC20P and RwFBWC20P are set to .W to indicate a Web interview and RwBWC20W and RwFBWC20W are set to .P to indicate a Face-to-Face/Telephone interview. In these cases, when RwBWC20P and RwFBWC20P are set to .W the the cognition values are in RwBWC20W and RwFBWC20W and when RwBWC20W and RwFBWC20W are set to .P the cognition values are in RwBWC20P and RwFBWC20P.

The Sw backwards counting variables were taken from the respective Rw variables for the Wave "w" spouse.

### **Cross Wave Differences in Original HRS Data**

Counting backwards from 20 is included in interviews for Wave 2A, and from Wave 3 forward. Counting backwards from 86 is included for Wave 3H and Waves 4 to 6. Neither test was included in interviews for Waves 1 and 2H.

Instructions were added in Wave 3 asking that the Respondent count backwards as quickly as possible.

In Waves 14 forward, RwBWC20 is separated into two variables: RwBWC20P for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwBWC20W for Respondents who performed the cognition measures during a Web interview. RwFBWC20 is similarly separated into RwFBWC20P and RwFBWC20W for Waves 14 forward. See the General Comments and How Constructed sections above for more information.

<b>Imputed Cognition: Date Naming</b>

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

RwDY, RwMO, RwYR, RwDW, RwDYP, RwMOP, RwYRP, and RwDWP indicate whether the Respondent was able to report today's date correctly, including the day of month, month, year, and day of week, respectively. RwDY, RwMO, RwYR, and RwDW provide this information from Wave 2 to Wave 13 and RwDYP, RwMOP, RwYRP, and RwDWP provide this information from Wave 14 forward.

Each of these variables is coded "1" for a correct answer and "0" for an incorrect answer. From Wave 4 forward the question is only asked of new interviewees and re-interviewees who are 65 or older. If the question was skipped because the Respondent is younger than 65, then special missing value .N is assigned. From Wave 14 forward, the questions are skipped for Web interviews. If the question was skipped because of a Web interview, then special missing value .W is assigned. The variable rename in Wave 14 forward, from RwDY, RwMO, RwYR, and RwDW to RwDYP, RwMOP, RwYRP, and RwDWP, reinforces this change.

RwFDY, RwFMO, RwFYR, RwFDW, RwFDYP, RwFMOP, RwFYRP, and RwFDWP indicate whether the values were imputed (=1) or not (=0). They have a value of "2" if the question was skipped because the Respondent is a re-interviewee younger than 65 or was a Web interviewee. RwFDY, RwFMO, RwFYR, and RwFDW provide this information from Wave 2 to Wave 13 and RwFDYP, RwFMOP, RwFYRP, and RwFDWP provide this information from Wave 14 forward. From Wave 14 forward, the questions are skipped for Web interviews and a value of "2" is assigned.

This task was not given to anyone in Waves 1 and 2H. In Wave 2H, R2 date naming variables are set to special missing .Q to

indicate that they are missing for all HRS Respondents.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done.

The Sw date naming variables were taken from the respective Rw variables for the Wave "w" spouse.

### **Cross Wave Differences in Original HRS Data**

This question was not asked in Waves 1 and 2H. From Wave 4 forward, it is only asked of new interviewees and re-interviewees who are 65 or older.

From Wave 14 forward, the questions are skipped for Web interviews. See the General Comments and How Constructed sections above for more information.

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

RwCACT, RwCACTP, RwSCIS and RwSCISP indicate whether the Respondent was able to correctly name these objects, cactus and scissors, respectively, based on a verbal description. For RwSCIS/RwSCISP the description was: "What do you usually use to cut paper?" and for RwCACT/RwCACTP it was, "What do you call the kind of prickly plant that grows in the desert?" RwCACT and RwSCIS provide this information from Wave 2 to Wave 13 and RwCACTP and RwSCISP provide this information from Wave 14 forward.

Each of these variables is code "1" for a correct answer and "0" for an incorrect answer. From Wave 4 forward these questions are only asked of new interviewees and re-interviewees who are 65 or older. If not asked because the Respondent is younger than 65, the Rw variables are set to special missing .N. From Wave 14 forward, the questions are skipped for Web interviews. If the question was skipped because of a Web interview, then special missing value .W is assigned. The variable rename in Wave 14 forward, from RwCACT and RwSCIS to RwCACTP and RwSCISP, reinforces this change.

RwFCACT, RwFCACTP, RwFSCIS, and RwFSCISP indicate whether the values were imputed (=1) or not (=0). They have a value of "2" if the question was skipped because the Respondent is a re-interviewee younger than 65 or was a Web interviewee. RwFCACT and RwFSCIS provide this information from Wave 2 to Wave 13 and RwFCACTP and RwFSCISP provide this information from Wave 14 forward. From Wave 14 forward, the questions are skipped for Web interviews and a value of "2" is assigned.

This task was not given to anyone in Waves 1 and 2H. In Wave 2H, R2 object naming variables are set to special missing .Q to

indicate that they are missing for all HRS Respondents.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done.

The Sw object naming variables were taken from the respective Rw variables for the Wave "w" spouse.

### **Cross Wave Differences in Original HRS Data**

These questions were not asked in Waves 1 and 2H. From Wave 4 forward, they are only asked of new interviewees and re-interviewees who are 65 or older.

From Wave 14 forward, the questions are skipped for Web interviews. See the General Comments and How Constructed sections above for more information.

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

RwPRES, RwPRES, RwVP, and RwVPP indicate whether the Respondent was able to correctly name the current president and vice-president of the United States, respectively. RwPRES and RwVP provide this information from Wave 2 to Wave 13 and RwPRES and RwVPP provide this information from Wave 14 forward.

Each of these variables is coded "1" for a correct answer and "0" for an incorrect answer. From Wave 4 forward, the question is only asked of new interviewees and re-interviewees who are 65 or older. If the question was skipped because the Respondent is younger than 65, then special missing value .N is assigned. From Wave 14 forward, the questions are skipped for Web interviews. If the question was skipped because of a Web interview, then special missing value .W is assigned. The variable rename in Wave 14 forward, from RwPRES and RwVP to RwPRES and RwVPP, reinforces this change.

RwFPRES, RwFPRES, RwFVP, and RwFVPP indicate whether the values were imputed (=1) or not (=0). They have a value of "2" if the question was skipped because the Respondent is a re-interviewee younger than 65 or was a Web interviewee. In Wave 5, the rate of correct answers increased, perhaps because Wave 5 (2000) was an election year, and the incumbent vice president was running for president. RwFPRES and RwFVP provide this information from Wave 2 to Wave 13 and RwFPRES and RwFVPP provide this information from Wave 14 forward. From Wave 14 forward, the questions are skipped for Web interviews and a value of "2" is assigned.

This task was not given to anyone in Waves 1 and 2H. In Wave 2H, R2PRES, R2VP, R2FPRES, and R2FVP are set to special missing .Q to indicate that they are missing for all HRS Respondents.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done.

The Sw president and vice-president naming variables were taken from the respective Rw variables for the Wave "w" spouse.

### **Cross Wave Differences in Original HRS Data**

These questions were not asked in Waves 1 and 2H. From Wave 4 forward, they are only asked of new interviewees and re-interviewees who are 65 or older.

From Wave 14 forward, the questions are skipped for Web interviews. See the General Comments and How Constructed sections above for more information.

### General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

### How Constructed

RwVOCAB and RwVOCABP score the Respondents ability to provide definitions of five given words. RwVOCAB provides this information from Wave 3 to Wave 13 and RwVOCABP provides this information from Wave 14 forward.

There are two sets of words, one of which is randomly assigned at the Respondent's first interview. The two sets are then alternated in subsequent waves. The two word sets are: 1) repair, fabric, domestic, remorse, plagiarize; and 2) conceal, enormous, perimeter, compassion, audacious.

These questions were asked from Wave 3 forward. From Wave 4 to Wave 11, it is only given to new interviewees and re-interviewees who are 65 or older. From Wave 7 to Wave 11, the vocabulary questions are skipped in odd waves (Waves 7,9, and 11) for re-interviewees. From Wave 12 forward, the vocabulary questions are only asked to new Respondents. From Wave 14 forward, the vocabulary questions are not asked to Web interviewees.

The possible scores for each word are perfectly correct (=2), partially correct (=1), and incorrect (0). RwVOCAB/RwVOCABP is the sum of scores over the five words. If this task was skipped because the Respondent is a re-interviewee younger than 65, then special missing value .N is assigned. From Wave 14 forward, if this task was skipped because the Respondent is a Web interviewee, then special missing value .W is assigned to RwVOCABP.

RwFVOCAB and RwFVOCABP indicate whether the values were imputed (=1) or not (=0). It has a value of 2 if the question

was skipped because the Respondent is a re-interviewee younger than 65 or was a Web interviewee. RwFVOCAB provides this information from Wave 3 to Wave 13 and RwFVOCABP provides this information from Wave 14 forward. From Wave 14 forward, the question is skipped for Web interviews and a value of "2" is assigned.

Note: Special missing values have been assigned to cognition measures when the Respondent has no non-proxy interviews (.X), the specific interview was by proxy (.S), cognition measure not asked (reinterview/lt 65) (.N), and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done.

SwVOCAB and SwFVOCAB were taken from the respective Rw variables for the Wave "w" spouse.

### **Cross Wave Differences in Original HRS Data**

This task was not given in Waves 1 and 2, but is given in all later waves. From Wave 4 to Wave 11, it is only given to new interviewees and re-interviewees who are 65 or older. From Wave 7 to Wave 11, the vocabulary questions are skipped in odd waves (Waves 7,9, and 11) for re-interviewees. From Wave 12 forward, the vocabulary questions are only asked to new Respondents. From Wave 14 forward, the vocabulary questions are not asked to Web interviewees (See the General Comments and How Constructed sections above for more information).

<b>Imputed Cognition: Summary Scores</b>

## General Comments

The cognition variables are taken directly from the HRS imputations of cognitive functioning. These imputations are (typically) calculated only for the final release data. In the prior release the HRS team was working on updates to the cognition measures during production, especially affecting Waves 14 and 15. These changes have been added to the current release. In the prior version we removed the cognition measures for these waves. Note that for Waves 14 forward, some cognition measures collected via Web interviews differed in their implementation, measurement, or collection method. Due to these differences, these cognition variables are separated into two measures: one ending in [P] for Face-to-Face/Telephone interviews and one ending in [W] for Web interviews. For some variables, only the [P] for Face-to-Face/Telephone interviews measure is provided. Please review the HRS documentation linked below and the specific variable documentation, when applicable, in this documentation section.

Please refer to the Health and Retirement Study Imputation of Cognitive Functioning Measures (1992 - 2020) (Final Version V3.0) Data Description (McCammon et al., May 2023) on the [HRS website](#) for a more detailed description of the measures and the imputation process. All questions on the construction of the variables should be directed to HRS.

## How Constructed

R1TR40, R2ATR20, R2HTR40, RwTR20, RwTR20P, and RwTR20W are summary scores for total word recall. R2AMSTOT, RwMSTOT, and RwMSTOTP summarize the mental status items. R2ACGTOT, RwCOGTOT, and RwCOGTOTP summarize word recall and mental status together. RwCOG27 summarizes word recall and a select set of mental status inputs together.

The total word recall summary variables sum the immediate and delayed word recall scores. In Waves 1 and 2H, the word list contained 20 nouns, while in other waves, the list contained 10 words. The variable name suffix indicates the maximum score possible for total word recall, e.g., R1TR40 (range 0-40) is the sum of R1IMRC20 (range 0-20) and R1DLRC20 (range 0-20), and R4TR20 (range 0-20) is the sum of R4IMRC (range 0-10) and R4DLRC (range 0-10). The variables R1TR40, R2HTR40, and R2ATR20 are named to indicate this difference in the measures for Waves 1 and 2. RwTR20 is available from Wave 3 to Wave 13. In Waves 14 forward, these word recall tests are performed differently for Web interviewees. To account for these differences, RwTR20 is separated into two variables: RwTR20P for Respondents who performed the cognition measures during a Face-to-Face/Telephone interview and RwTR20CW for Respondents who performed the cognition measures during a Web interview. Web interviewees have values of .W for RwTR20P and Face-to-Face/Telephone interviewees have values of .P for RwTR20W.

The mental status summary sums the scores for serial 7's (RwSER7[P/W], 0-5), backwards counting from 20 (RwBWC20[P/W], 0-2), and object (RwCACT[P], RwSCIS[P]; 0-2 total), date (RwDY[P], RwMO[P], RwYR[P], RwDW[P]; 0-4 total), and President/Vice-President (RwPRES[P], RwVP[P]; 0-2 total) naming tasks. The resulting range is 0-15. Since these items were not included in Waves 1 and 2H, there is no mental summary score for these waves, and the Wave 2A summary is called R2AMSTOT to indicate that it is limited to the AHEAD cohort in Wave 2. RwMSTOT is available from Wave 3 to Wave 13 and the listed sum variables are used without the [P] suffix. In Waves 14 forward, the date, object naming, and President/Vice-President naming tasks are not asked for Web interviewees and the listed sum variables are used with the [P] suffix. To account for this exclusion, RwMSTOT is renamed RwMSTOTP in Waves 14 forward to indicate it is not available for Web interviewees. Web interviewees have a value of .W for RwMSTOTP.

The total cognition score sums the total word recall and mental status summary scores, resulting in a range of 0-35. For Wave 2A, R2ACOGTOT is the sum of R2ATR20 and R2AMSTOT. RwCOGTOT is the sum of RwTR20 and RwMSTOT for Waves 3-13. RwCOGTOTP is the sum of RwTR20P and RwMSTOTP for Wave 14 forward and excludes Web interviewees. Web interviewees have a value of .W for RwCOGTOTP. RwCOGTOT is not available in Waves 1 and 2H.

RwCOG27 sums total word recall (RwTR20[P/W], 0-20), serial 7's (RwSER7[P/W], 0-5), and backwards counting from 20 (RwBWC20[P/W], 0-2), resulting in a range of 0-27. RwCOG27 is available in Waves 3 forward and is mode-adjusted from Wave 14 forward. It is available for a larger sample than RwCOGTOT[P] but still has exclusions.

In Wave 2H, R2ATR20, R2AMSTOT, and R2ACGTOT are set to special missing .Q to indicate that they are missing for all HRS Respondents. In Wave 2H, R2HTR40 is set to special missing .Q to indicate that it is missing for all AHEAD Respondents.

Special missing values have been assigned to cognition measures for: Respondents with all proxy interviews (.X); the specific interview was by proxy (.S); cognition measure not asked (reinterview/lt 65) (.N); and in Wave 1 when the Respondent is an HRS/AHEAD overlap case (.C). In these cases, imputations were not done.

NOTE: Because RwCOGTOT/RwCOGTOTP sums several input variables, the sample depends on the sample of the input variables. Users should note that these variables include questions only asked of Respondents over 65 or new Respondents. Additionally, proxy respondents are not asked the questions. Finally, in Waves 14 forward, RwCOGTOTP excludes web interviewees. Users should use the special missing values described above and review the documentation sections for the input variables for more details on the RwCOGTOT/RwCOGTOTP sample. Further information can be found in the HRS documentation linked in the General Comments section above.

The Sw cognition summary variables were taken from the respective Rw variables for the Wave "w" spouse.

## How Constructed

### Core Interview Variables

RwPRMEM provides a proxy-reported rating of the Respondent's memory at the time of their interview. RwPRMEM ranges from 1 (Excellent) to 5 (Poor). RwPRCHMEM provides a proxy-reported rating of the Respondent's change in memory over the past two years. RwPRCHMEM takes values 1 (Better), 2 (Same), and 3 (Worse).

RwPRMEM is asked to the proxy in Wave 2A and in Wave 3 on. It is not asked in Wave 2H, and proxy interviews in Wave 2H have a value of .Q for R2PRMEM. RwPRCHMEM is asked to the proxy starting in Wave 4.

RwPRCHMEM is only asked to the proxy if the Respondent is younger than 65 at the time of the interview. Respondents who were 65 or older at the time of their proxy interview have a value of .S for RwPRCHMEM.

If the interview was not conducted via proxy, then RwPRMEM and RwPRCHMEM are set to .Z=Non-Proxy.

SwPRMEM and SwPRCHMEM contain this information for the Respondent's spouse or partner.

### Exit Interview Variables

REPRMEM provides a proxy-reported rating of the Respondent's memory as of one month before the Respondent's death. REPRMEM ranges from 1 (Excellent) to 5 (Poor).

REPRMEM is asked of the proxy from Wave 3 forward. Exit interviews that take place in Wave 2H are given a value of .Q.

## How Constructed

### Core Interview Variables

RwLOST, RwWANDER, RwALONE and RwhALUC indicate whether the Respondent in a proxy interview shows signs of cognitive impairment.

RwLOST indicates whether the Respondent ever gets lost in familiar environments. RwWANDER indicates whether the Respondent ever wanders off and doesn't return on his or her own. RwALONE indicates whether the Respondent can be left alone for an hour or so. RwhALUC indicates whether the Respondent ever sees or hears things that aren't really there.

These variables are not collected in Waves 1 or 2H. The variables are set to .Q if the Respondent's proxy interview took place in Wave 2H.

In Wave 3, A "don't do" response is recoded to missing value .X, since the proxy hasn't revealed whether the Respondent would have difficulty with the activity if the Respondent ever did it.

In Waves 2A and 3, these questions are asked in all proxy interviews. In Waves 4 and on, these variables are only asked to the proxy if the Respondent is 65 or older at the time of the interview. Respondents who were younger than 65 at the time of their proxy interview have a value of .S for RwLOST, RwWANDER, RwALONE and RwhALUC. If the interview was not conducted via proxy, then RwLOST, RwWANDER, RwALONE and RwhALUC are set to .Z=Non-Proxy.

SwLOST, SwWANDER, SwALONE and SwHALUC contain this information for the Respondent's spouse or partner.

### Exit Interview Variables

RELOST, REWANDER, REALONE, and REHALUC indicate whether the Respondent showed signs of cognitive impairment since the Respondent's last interview.

RELOST indicates whether the Respondent ever got lost in familiar environments. REWANDER indicates whether the Respondent ever wandered off and didn't return on their own. REALONE indicates whether the Respondent could be left alone for an hour or so. REHALUC indicates whether the Respondent ever saw or heard things that weren't really there.

These questions are not asked in Wave 2H, so the variables are set to .Q.

In Wave 3, these questions are asked in all Exit Interviews. From Wave 4 forward, these questions are only asked if the Respondent was age 65 or older at time of death. Respondents from Wave 4 forward who are under age 65 are given the value .S for RELOST, REWANDER, REALONE and REHALUC.

## HRS Variables Used

### Core Interview Variables

AHEAD 1993:

B342	PC7a. DOES R GET LOST
B343	PC7b. DOES R WANDER
B344	PC7c. CAN R BE LEFT ALONE
B345	PC7d. DOES R HALLUCINATE

AHEAD 1995:

D1144	PC24.LOST
D1145	PC25.WANDER
D1146	PC26.LEFT ALONE
D1147	PC27.HALLUCINATE

HRS 1996:

E1144	PC24.LOST
E1145	PC25.WANDER
E1146	PC26.LEFT ALONE
E1147	PC27.HALLUCINATE

HRS 1998:

F1461	PC24.LOST
F1462	PC25.WANDER
F1463	PC26.LEFT ALONE
F1464	PC27.HALLUCINATE

HRS 2000:

G1615	PC24.LOST
G1616	PC25.WANDER
G1617	PC26.LEFT ALONE
G1618	PC27.HALLUCINATE

HRS 2002-2020:

xD554	GET LOST IN FAMILIAR PLACES- PC
xD555	WANDER OFF- PC
xD556	CAN R BE LEFT ALONE- PC
xD557	DOES R HALLUCINATE- PC

### Exit Interview Variables

AHEAD 1995:

N1144	PC24.LOST

## How Constructed

RwBPSYS summarizes the Respondent's systolic blood pressure measurements taken during the in-home physical measurements portion of the HRS. RwbPDIA summarizes the Respondent's diastolic blood pressure measurements. RwbPPULS summarizes the Respondent's pulse measurements in beats per minute. RwbPPOS describes the Respondent's position during these measurements.

From Wave 8 forward, a subsample of HRS Respondents are selected each wave to complete an enhanced face-to-face interview. Respondents who were not selected in a given wave do not have blood pressure data. RwbBPSYS, RwbPDIA, RwbPPULS, and RwbPPOS are set to .A for these Respondents.

Respondents who are selected for an enhanced interview may not be able to actually carry out a face-to-face interview. Respondents who were selected but were living in a nursing home, had a proxy respondent, or had to conduct their interview by telephone do not have physical measurement data. RwbBPSYS, RwbPDIA, RwbPPULS, and RwbPPOS are set to .N for these Respondents.

Respondents who were selected for an enhanced interview and were able to conduct a face-to-face interview were given a description of the physical tests that they would be asked to carry out. They were then asked to sign a Physical Measures consent form. Respondents who did not sign the Physical Measures consent form do not have physical measurement data. RwbBPSYS, RwbPDIA, RwbPPULS, and RwbPPOS are set to .E for these Respondents.

From Wave 12 forward, Respondents who consent to having physical measurements taken are asked a series of questions prior to taking blood pressure measurements. Respondents are asked if their left arm is safe to take blood pressure measures on (no open wounds, rashes, etc.). If it is not, Respondents are asked if their right arm is safe. If neither arm is safe, the blood pressure measurements are skipped. RwbBPSYS, RwbPDIA, RwbPPULS, and RwbPPOS are set to .X for these Respondents. Also from Wave 12 forward,

Respondents are asked if they feel safe continuing each section of the measurements. RwBPSYS, RwBPDIA, RwBPPULS, and RwBPPOS are set to .R for Respondents who did not feel safe taking the blood pressure measurements.

Blood pressure and pulse measures are taken three times each. If there are three valid systolic blood pressure measurements, RwBPSYS reports the mean of the second and third measurement. Else if there are one or two valid systolic blood pressure measurements, RwBPSYS reports the mean of all valid measurements. Similarly, if there are three valid diastolic blood pressure measurements, RwBPDIA reports the mean of the second and third measurements. Else if there are one or two valid diastolic blood pressure measurements, RwBPDIA reports the mean of all valid measurements. RwBPULS reports the mean of all valid pulse measurements in beats per minute.

The Respondent's blood pressure measurements may be unsuccessful for several reasons. If the Respondent feels unsafe during the measurement and refuses to proceed, the variable is set to .R. If the Respondent is medically disqualified from the measurement, the variable is set to .X. If the Respondent attempts the measurement but is unable to complete it, the variable is set to .W. If the interviewer is unable to conduct the test due to lack of suitable location or equipment problems, the variable is set to .L. If the Respondent is listed as "DK (Don't Know); NA (Not Ascertained)" in the survey and the corresponding variable has no non-missing values, the variable is set to .D. If all of RwBPSYS, RwBPDIA and RwBPPULS are missing for these reasons, RwBPPOS is set to .S.

If a variable is missing and causes an exit from the blood pressure measurements, variables collected afterwards are set to .S if no measurements were taken.

Variables are set to .M if the raw variable does not have data on the measurements, but none of the previous missing codes apply.

SwBPSYS, SwBPDIA, SwBPPULS, and SwBPPOS contain this information for the Respondent's spouse or partner.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## Cross Wave Differences in Original HRS Data

Physical measurements are first conducted in Wave 8.

From Wave 12 forward, Respondents are asked preliminary safety and consent questions for each set of physical measurements questions (this is in addition to signing the consent form, which happens in every wave). From Wave 12 forward, Respondents are asked if they feel safe continuing to the blood pressure section. Additionally, they are asked if they have any issues with their arms (open wounds, rashes, etc.) that would prevent blood pressure measurements from being taken.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## How Constructed

RwPUFF summarizes the Respondent's performance on breathing test measurements taken during the in-home physical measurements portion of the HRS. The breathing test is measured in liters per minute. RwPUFFPOS describes the Respondent's position during these measurements.

The breathing test measurements are taken three times. RwPUFF takes the maximum of all non-missing breathing test measurements for the Respondent.

From Wave 8 forward, a subsample of HRS Respondents are selected each wave to complete an enhanced face-to-face interview. Respondents who were not selected in a given wave do not have breathing test data. RwPUFF and RwPUFFPOS are set to .A for these Respondents.

Respondents who are selected for an enhanced interview may not be able to actually carry out a face-to-face interview. Respondents who were selected but were living in a nursing home, had a proxy respondent, or had to conduct their interview by telephone do not have physical measurement data. RwPUFF and RwPUFFPOS are set to .N for these Respondents.

Respondents who were selected for an enhanced interview and were able to conduct a face-to-face interview were given a description of the physical tests that they would be asked to carry out. They were then asked to sign a Physical Measures consent form. Respondents who did not sign the Physical Measures consent form do not have physical measurement data. RwPUFF and RwPUFFPOS are set to .E for these Respondents.

From Wave 12 forward, Respondents who consent to having physical measurements taken are asked if they feel safe continuing each section of the measurements. RwPUFF and RwPUFFPOS are set to .R for Respondents who did not feel safe taking the breathing test measurements.

Respondents who were otherwise willing to take physical measurements may not have data for breathing test measurements due to space or equipment issues. If there was not a suitable location to carry out the breathing test measurements or there was problems with equipment or supplies, the breathing test measurements are skipped. RwPUFF is set to .L for these Respondents.

The Respondent's breathing test measurements may be unsuccessful for several reasons. If the Respondent feels unsafe during the measurement and refuses to proceed, the variable is set to .R. If the Respondent is medically disqualified from the measurement, the variable is set to .X. If the Respondent attempts the measurement but is unable to complete it, the variable is set to .W. If the interviewer is unable to conduct the test due to lack of suitable location or equipment problems, the variable is set to .L. If the Respondent is listed as "DK (Don't Know); NA (Not Ascertained)" in the survey and the corresponding variable has no non-missing values, the variable is set to .D. If RwPUFF is missing for these reasons, RwPUFFPOS is set to .S.

If a variable is missing and causes an exit from the breathing test measurements, variables collected afterwards are set to .S if no measurements were taken. Variables are set to .M if the raw variable does not have data on the measurements, but none of the previous missing codes apply.

SwPUFF and SwPUFFPOS contain this information for the Respondent's spouse or partner.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## Cross Wave Differences in Original HRS Data

Physical measurements are first conducted in Wave 8.

There are some changes to the way missing codes are handled in the survey. From Wave 12 forward, Respondents are asked preliminary safety and consent questions for each set of physical measurements questions (this is in addition to signing the consent form, which happens in every wave). From Wave 12 forward, Respondents are asked if they feel safe continuing to the breathing test section.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

2.Sitting		162	178	207	145
3.Lying Down		5	1	4	1

## How Constructed

RwGRP, RwGRPL, and RwGRPR summarize the Respondent's grip strength measurements taken during the in-home physical measurements portion of the HRS. RwGRP is a summary measurement of both hands whereas RwGRPL and RwGRPR refer to the left- and right-hand, respectively. Grip strength measurements are reported to the nearest 0.5 kilograms. RwGRPDOM lists the Respondent's dominant hand. RwGRPPOS describes the Respondent's position during these measurements.

Grip strength measurements are taken twice on each hand. RwGRP reports the maximum value of all valid grip strength measurements. RwGRPL and RwGRPR report the maximum of all non-missing measurements of the Respondent's left- and right-handed grip strength, respectively.

From Wave 8 forward, a subsample of HRS Respondents are selected each wave to complete an enhanced face-to-face interview. Respondents who were not selected in a given wave do not have grip strength data. RwGRP, RwGRPL, RwGRPR, RwGRPDOM and RwGRPPOS are set to .A for these Respondents.

Respondents who are selected for an enhanced interview may not be able to actually carry out a face-to-face interview. Respondents who were selected but were living in a nursing home, had a proxy respondent, or had to conduct their interview by telephone do not have physical measurement data. RwGRP, RwGRPL, RwGRPR, RwGRPDOM and RwGRPPOS are set to .N for these Respondents.

Respondents who were selected for an enhanced interview and were able to conduct a face-to-face interview were given a description of the physical tests that they would be asked to carry out. They were then asked to sign a Physical Measures consent form. Respondents who did not sign the Physical Measures consent form do not have physical measurement data. RwGRP, RwGRPL, RwGRPR, RwGRPDOM and RwGRPPOS are set to .E for these Respondents.

From Wave 12 forward, Respondents who consent to having physical measurements taken are asked a series of questions prior to taking grip strength measurements. Respondents are asked if it is safe to conduct grip strength tests on each arm (no severe swelling, pain, hand injury, etc.). Grip strength tests are skipped on any hand that is unsafe for testing. Variables are set to .X if they are skipped due to safety. Also from Wave 12 forward, Respondents are asked if they feel safe continuing each section of the measurements. RwGRP, RwGRPL, RwGRPR, RwGRPDOM and RwGRPPOS are set to .R for Respondents who did not feel safe conducting grip strength measurements.

Respondents who were otherwise willing to take physical measurements may not have data for grip strength measurements due to space or equipment issues. If there was not a suitable location to carry out the grip strength measurements or there was problems with equipment or supplies, the grip strength measurements are skipped. RwGRP, RwGRPL, RwGRPR, RwGRPDOM and RwGRPPOS are set to .L for these Respondents.

The Respondent's grip strength measurements may be unsuccessful for several reasons. If the Respondent feels unsafe during the measurement and refuses to proceed, the variable is set to .R. If the Respondent is medically disqualified from the measurement, the variable is set to .X. If the Respondent attempts the measurement but is unable to complete it, the variable is set to .W. If the interviewer is unable to conduct the test due to lack of suitable location or equipment problems, the variable is set to .L. If the Respondent is listed as "DK (Don't Know); NA (Not Ascertained)" in the survey and the corresponding variable has no non-missing values, the variable is set to .D. If RwGRP, RwGRPL, RwGRPR and RwGRPDOM are missing for these reasons, RwGRPPOS is set to .S.

If a variable is missing and causes an exit from the grip strength measurements, variables collected afterwards are set to .S if no measurements were taken. Variables are set to .M if the raw variable does not have data on the measurements, but none of the previous missing codes apply.

SwGRP, SwGRPL, SwGRPR, SwGRPDOM and SwGRPPOS contain this information for the Respondent's spouse or partner.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## Cross Wave Differences in Original HRS Data

Physical measurements are first conducted in Wave 8.

There are some changes to the way missing codes are handled in the survey. From Wave 12 forward, Respondents are asked preliminary safety and consent questions for each set of physical measurements questions (this is in addition to signing the consent form, which happens in every wave). From Wave 12 forward, Respondents are asked if they feel safe continuing to the grip strength section. Additionally, they are asked if they have any issues with either hand (severe swelling, pain, hand injury, etc.) that would prevent grip strength measurements from being taken.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## HRS Variables Used

HRS 2006-2018:

xI800	PHYSICAL MEASURES FTF IW
xI802	PHYSICAL MEASURES CONSENT FORM
xI813M1	HAND STRENGTH TEST REASON NOT COMPLETE-1
xI815	GRIP DOMINANT HAND
xI816	LEFT HAND FIRST
xI818	HAND STRENGTH TEST R POSITION
xI851	RIGHT HAND FIRST
xI852	LEFT HAND SECOND
xI853	RIGHT HAND SECOND
xPMELIG	2006 PHYSICAL MEASURES ELIGIBILITY

HRS 2014-2018:

xI967	AFFECTED HAND(S)
xI968	HAND-STRENGTH SAFETY QUESTION

## How Constructed

RwBALSEMI records the time, up to ten seconds, the Respondent held a Semi-Tandem stand during the in-home physical measurements portion of the HRS. RwBALSBS records the time, up to 30 seconds, the Respondent held a Side-by-Side stand. RwBALFUL records the time in seconds the Respondent held a Full-Tandem stand. RwBALFULT records if the Respondent held a Full-Tandem stand the maximum amount of time applicable to them. RwBALSEMIC, RwBALSBS and RwBALFULC describe whether the Respondent

made any compensatory movements during each respective test.

From Wave 8 forward, a subsample of HRS Respondents are selected each wave to complete an enhanced face-to-face interview. Respondents who were not selected in a given wave do not have balance test data. These variables are set to .A for these Respondents.

Respondents who are selected for an enhanced interview may not be able to actually carry out a face-to-face interview. Respondents who were selected but were living in a nursing home, had a proxy respondent, or had to conduct their interview by telephone do not have physical measurement data. These variables are set to .N for these Respondents.

Respondents who were selected for an enhanced interview and were able to conduct a face-to-face interview were given a description of the physical tests that they would be asked to carry out. They were then asked to sign a Physical Measures consent form. Respondents who did not sign the Physical Measures consent form do not have physical measurement data. These variables are set to .E for these Respondents.

From Wave 12 forward, Respondents who consent to having physical measurements taken are asked if they feel safe continuing each section of the measurements. A separate question is asked for each type of balance test (Semi-Tandem, Side-by-Side and Full-Tandem). The corresponding time held and compensatory movement variables are set to .R for Respondents who did not feel safe taking a balance test.

Respondents who were otherwise willing to take physical measurements may not have data for balance measurements due to space or equipment issues. If there was not a suitable location to carry out the balance measurements or there was problems with equipment or supplies, the balance measurements are skipped. These variables are set to .L for these Respondents.

Respondents who take the balance tests are first asked to hold a semi-tandem stand for 10 seconds. The time the Respondent was able to hold the semi-tandem stand is recorded in RwbALSEMI in seconds, up to two decimal places. RwbALSEMIC records if the Respondent made any compensatory movements to steady themselves during this test.

If the Respondent was unable to hold the semi-tandem stand for 10 seconds, they are asked to hold a side-by-side stand for 30 seconds. The time the Respondent was able to hold the side-by-side stand is recorded in RwbALSBS in seconds, up to two decimal places. RwbALSBS records if the Respondent made any compensatory movements to steady themselves during this test. If the Respondent does hold the semi-tandem stand for 10 seconds, they are not asked to hold the side-by-side stand and RwbALSBS is set to .T.

If the Respondent was able to hold the semi-tandem stand for 10 seconds, they are asked to hold a full-tandem stand. Respondents under the age of 70 are asked to hold the full-tandem stand for one minute, while Respondents 70 and older are asked to hold the full-tandem stand for 30 seconds. The time the Respondent was able to hold the full-tandem stand is recorded in RwbALFUL in seconds, up to two decimal places. RwbALFUL reports if the Respondent held the full-tandem stand the maximum amount of time that they were asked to hold it for. RwbALFULC records if the Respondent made any compensatory movements to steady themselves during this test. If the Respondent was unable hold the semi-tandem stand for 10 seconds, they are not asked to hold a full-tandem stand and RwbALFUL is set to .T.

The Respondent's balance test measurements may be unsuccessful for several reasons. If the Respondent feels unsafe during the measurement and refuses to proceed, the variable is set to .R. If the Respondent is medically disqualified from the measurement, the variable is set to .X. If the Respondent attempts the measurement but is unable to complete it, the variable is set to .W. If the interviewer is unable to conduct the test due to lack of suitable location or equipment problems, the variable is set to .L. If the Respondent is listed as "DK (Don't Know); NA (Not Ascertained)" in the survey and the corresponding variable has no non-missing values, the variable is set to .D. If a variable is missing for these reasons, the corresponding Compensatory Movements variable is set to .S.

If a variable is missing and causes an exit from the balance test measurements, variables collected afterwards are set to .S if no measurements were taken. Variables are set to .M if the raw variable does not have data on the measurements, but none of the previous missing codes apply.

SwBALSEMI, SwBALSBS, SwBALFUL, SwBALSEMIC, SwBALSBS, SwBALFULC and SwBALFUL contain this information for the Respondent's spouse or partner.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## Cross Wave Differences in Original HRS Data

Physical measurements are first conducted in Wave 8.

There are some changes to the way missing codes are handled in the survey. From Wave 12 forward, Respondents are asked preliminary safety and consent questions for each set of physical measurements questions (this is in addition to signing the consent form, which happens in every wave). From Wave 12 forward, Respondents are asked if they feel safe continuing to each new balance test.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## How Constructed

RwTIMWLK summarizes the Respondent's performance in the timed walk tests during the in-home physical measurements portion of the HRS. It records the minimum number of seconds the Respondent took to walk 98.5 inches at a normal pace. RwTIMWLKA describes the type of walking aid that the Respondent used during these measurements.

Timed walk tests are taken two times. Measurements are taken in seconds to two decimal places. RwTIMWLK takes the minimum of all non-missing measurements.

From Wave 8 forward, a subsample of HRS Respondents are selected each wave to complete an enhanced face-to-face interview. Respondents who were not selected in a given wave do not have timed walk data. RwTIMWLK and RwTIMWLKA are set to .A for these Respondents.

Respondents who are selected for an enhanced interview may not be able to actually carry out a face-to-face interview. Respondents who were selected but were living in a nursing home, had a proxy respondent, or had to conduct their interview by telephone do not have physical measurement data. RwTIMWLK and RwTIMWLKA are set to .N for these Respondents.

Respondents who were selected for an enhanced interview and were able to conduct a face-to-face interview were given a description of the physical tests that they would be asked to carry out. They were then asked to sign a Physical Measures consent form. Respondents who did not sign the Physical Measures consent form do not have physical measurement data. RwTIMWLK and RwTIMWLKA are set to .E for these Respondents.

From Wave 12 forward, Respondents aged 65 and older who consent to having physical measurements taken are asked a series of questions prior to taking timed walk tests. Respondents are asked if they have any problems from recent surgery, injury, or other health conditions that might prevent them from walking. If the Respondent answers that they have a restriction, the timed walk tests are skipped. RwTIMWLK and RwTIMWLKA are set to .X for these Respondents. Also from Wave 12 forward, Respondents are asked if they feel safe continuing each section of the measurements. RwTIMWLK and RwTIMWLKA are set to .R for Respondents who did not feel safe taking the timed walk tests.

Respondents under the age of 65 are not asked to complete timed walk measurements. Respondents who were eligible to take physical measurement tests in a wave and had signed the consent form but were under the age of 65 are given a value of .S for RwTIMWLK and RwTIMWLKA.

The Respondent's timed walk measurements may be unsuccessful for several reasons. If the Respondent feels unsafe during the measurement and refuses to proceed, the variable is set to .R. If the Respondent is medically disqualified from the measurement, the variable is set to .X. If the Respondent attempts the measurement but is unable to complete it, the variable is set to .W. If the interviewer is unable to conduct the test due to lack of suitable location or equipment problems, the variable is set to .L. If the Respondent is listed as "DK (Don't Know); NA (Not Ascertained)" in the survey and the corresponding variable has no non-missing values, the variable is set to .D. If RwTIMWLK is missing for these reasons, RwTIMWLKA is set to .S.

SwTIMWLK and SwTIMWLKA contain this information for the Respondent's spouse or partner.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## Cross Wave Differences in Original HRS Data

Physical measurements are first conducted in Wave 8.

There are some changes to the way missing codes are handled in the survey. From Wave 12 forward, Respondents are asked preliminary safety and consent questions for each set of physical measurements questions (this is in addition to signing the consent form, which happens in every wave). From Wave 12 forward, Respondents are asked if they feel safe continuing to the timed walk section. Additionally, they are asked if they have any health issues that would prevent timed walk measurements from being taken.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## General Comments

RwPMBMI, RwPMHGHT, RwPMWGHT, and RwPMWAIST are based on physically-measured data. Please refer to the "Self-reported BMI, Height, Weight" section for RwBMI, RwHEIGHT, and RwWEIGHT, which are based on self-reported (or proxy-reported) data.

## How Constructed

RwPMBMI reports the Respondent's body mass index based on their measured height (in inches) and weight (in pounds). RwPMHGHT records the physical measure of the Respondent's height in inches. RwPMHGHTS records whether the Respondent was wearing shoes during this measurement. RwPMWGHT records the physical measure of the Respondent's weight in pounds. RwPMWGHTS records whether the Respondent was wearing shoes during this measurement, and RwPMWGHTF records the type of floor that the scale was on during the measurement. RwPMWAIST records the measurement of the Respondent's waist circumference in inches. RwPMWAISTC records whether the Respondent was wearing any bulky clothing during this measurement.

From Wave 8 forward, a subsample of HRS Respondents are selected each wave to complete an enhanced face-to-face interview. Respondents who were not selected in a given wave do not have physical measurement data. RwPMBMI, RwPMHGHT, RwPMHGHTS, RwPMWGHT, RwPMWGHTS, RwPMWGHTF, RwPMWAIST and RwPMWAISTC are set to .A for these Respondents.

Respondents who are selected for an enhanced interview may not be able to actually carry out a face-to-face interview. Respondents who were selected but were living in a nursing home, had a proxy respondent, or had to conduct their interview by telephone do not have physical measurement data. RwPMBMI, RwPMHGHT, RwPMHGHTS, RwPMWGHT, RwPMWGHTS, RwPMWGHTF, RwPMWAIST and RwPMWAISTC are set to .N for these Respondents.

Respondents who were selected for an enhanced interview and were able to conduct a face-to-face interview were given a description of the physical tests that they would be asked to carry out. They were then asked to sign a Physical Measures consent form. Respondents who did not sign the Physical Measures consent form do not have physical measurement data. RwPMBMI, RwPMHGHT, RwPMHGHTS, RwPMWGHT, RwPMWGHTS, RwPMWGHTF, RwPMWAIST and RwPMWAISTC are set to .E for these Respondents.

From Wave 12 forward, Respondents who consent to having physical measurements taken are asked if they feel safe having their height, weight and waist size measured. Variables are set to .R for Respondents who did not feel safe taking the corresponding measurement.

RwPMHGHT records the measurement of the Respondent's height. Height, given in inches, is converted to meters.

Respondents who self-reported a weight of 300 pounds or more were not asked to complete a physical measurement of weight. RwPMWGHT, RwPMWGHTS and RwPMWGHTF are set to .S for these Respondents. If a Respondent is measured, RwPMWGHT records the Respondent's weight. Weight, measured in pounds, is converted to kilograms.

RwPMBMI is calculated using the weight divided by the square height  $\frac{weight}{height^2}$ .

RwPMWAIST records the measurement of the Respondent's waist circumference in inches, rounded to the nearest quarter inch. Respondents are asked to stand and raise their arms while the interviewer measures their waist circumference at navel level.

The Respondent's measurements may be unsuccessful for several reasons. If the Respondent feels unsafe during the measurement and refuses to proceed, the variable is set to .R. If the Respondent is medically disqualified from the measurement, the variable is set to .X. If the Respondent attempts the measurement but is unable to complete it, the variable is set to .W. If the interviewer is unable to conduct the test due to lack of suitable location or equipment problems, the variable is set to .L. If the Respondent is listed as "DK (Don't Know); NA (Not Ascertained)" in the survey and the corresponding variable has no non-missing values, the variable is set to .D. If a variable is missing for one of these reasons, the corresponding auxiliary variables for Shoes, Floor Type or Bulky Clothes are set to .S. If RwPMHGHT or RwPMWGHT is missing for one of these reasons, RwPMBMI will be set to the corresponding missing value.

RwPMBMI, RwPMHGHT, RwPMHGHTS, RwPMWGHT, RwPMWGHTS, RwPMWGHTF, RwPMWAIST and RwPMWAISTC are set to .M if the raw variable does not have data on the measurements, but none of the previous missing codes apply.

SwPMBMI, SwPMHGHT, SwPMHGHTS, SwPMWGHT, SwPMWGHTS, SwPMWGHTF, SwPMWAIST and SwPMWAISTC contain this information for the Respondent's spouse or partner.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## Cross Wave Differences in Original HRS Data

Physical measurements are first conducted in Wave 8.

There are some changes to the way missing codes are handled in the survey. From Wave 12 forward, Respondents are asked preliminary safety and consent questions for each set of physical measurements questions (this is in addition to signing the consent form, which happens in every wave). From Wave 12 forward, Respondents are asked if they feel safe continuing to each different physical measure.

Physical measure variables are not available for Wave 15 because there were no enhanced face-to-face interviews due to Covid-19.

## How Constructed

RwHLTHLM indicates whether an impairment or health problem limits the kind or amount of paid work for the Respondent. SwHLTHLM is the same information for the Respondent's spouse or partner.

RwHLTHLM simply recodes the original HRS variable as a yes/no indicator and sets missing values to missing codes.

In Waves 2A and 3A, this question was not asked. So for the AHEAD Respondents, R2HLTHLM and R3HLTHLM are set to the .Q SAS special missing value, to indicate that no information is available.

The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., S1HLTHLM is taken from the Wave 1 spouse's R1HLTHLM.

## Cross Wave Differences in Original HRS Data

In Waves 2A and 3A, the question about health affecting or limiting any work is not asked.

The question wording is the same in all other waves:

"Now I want to ask how your health affects paid work activities. Do you have any impairment or health problem that limits the kind or amount of paid work you can do?"

From Wave 4 forward, the same question is asked in two sections. One is the disability section for re-interviewees, and one is the disability section for new interviewees.

In Wave 7, if re-interviewees have previously reported a health limitation, these questions are skipped and assigned ".Y=Assumed Yes." This skip pattern bypasses the Respondents that have previously reported a health limitation, but may no longer have a limitation. From Wave 7 forward, "not working," recoded .W, is added as a possible answer.

### Categorical Variable Codes

---

REBEDRID: EXIT Bedridden around time of death

---

Value	
.D=DK	964
.M=Oth missing	17
.Q=Not asked this wv	175
.R=RF	18
.Y=No Exit Interview, No De	24500
.Z=No Exit Interview, Death	1394
0.No	10863
1.Yes	4474

### How Constructed

REBEDRID indicates whether the Respondent was bedridden in the last three months of life. This variable recodes raw data about the number of days the Respondent stayed in bed more than half of the day because of illness or injury during their last three months of life. It indicates whether the total number of days reported is greater than or equal to 86. If a Respondent spent 86 or more days in bed, the Activities of Daily Life section is skipped in some waves of the Exit Interview.

The question was not asked in Wave 2H. REBEDRID is set to .Q if the Respondent's Exit Interview took place in Wave 2H.

### Cross Wave Differences in Original HRS Data

The response options vary across waves. From Wave 3 to Wave 6, the maximum value for the raw data was 93, and this was also the value assigned to responses of "every day." From Wave 7 forward, the value of 93 corresponds to "every day." In some later waves, a small number of values above 93 are seen, but no values above 100 are seen. Values above the possible number of days in a three month period are treated the same as "every day" responses, and the Respondent is set to bedridden.

0.Asked ADL questions	7471	6687	6934	5537	4800
1.Skips ADL questions	5009	4322	4838	3815	3667

## How Constructed

RwSADLF indicates if the Respondent was not asked (i.e. skipped) the activities of daily living (ADL) questions. SwSADLF is the same information for the Respondent's spouse or partner.

From Wave 3 forward, ADL questions are skipped if no difficulty was reported with any of the tasks asked about earlier (See the "Other Functional Limitations" sections). In these cases, Rw[adl] is set to "no difficulty." From Wave 4 forward, if difficulty with only one prior task and no difficulty with dressing was reported, the questions about the rest of the ADLs are skipped. In these cases, the rest of the Rw[adl] variables are also set to "no difficulty." The assumption is that, since the Respondent had no difficulty with the earlier activities, they would also have reported no difficulty to the activities in the skipped questions.

RwSADLF indicates which Respondents skipped the ADL questions and the Rw[adl] variables were assigned "no difficulty." A value of zero (0) indicates that the Respondent did not skip the ADL questions. A value of one (1) indicates that the Respondent skipped

the ADL questions and the Rw[adl] variables were assigned "no difficulty." A special missing value of .M indicates that the Respondent skipped earlier questions as well and may or may not have answered the ADL questions, but they were not assigned "no difficulty."

This variable is available from Wave 3 forward.

SwSADLF is taken from the Wave "w" spouse's self-reported RwSADLF variable.

## HRS Variables Used

AHEAD 1995:	
D1870	ADLCK.CKPT FOR SKIPPING ADL SERIES
HRS 1996:	
E1894	ADLCK.CKPT FOR SKIPPING ADL SERIES
HRS 1998:	
F2421	E71.PICK DIME
F2425	E73F.DRESS DIFF
HRS 2000:

## How Constructed

### Core Interview Variables

These variables recode the raw variables for difficulty with activities of daily living (ADLs) as they appear in the HRS data except for missing values and accounting for skip patterns. The ADLs include walking across a room (RwWALKR), dressing (RwDRESS), bathing (RwBATH), eating (RwEAT), getting in and out of bed (RwBED), and using the toilet (RwTOILT). In the following, references to Rw[adl] apply to all these variables. Also described here are variables coding whether the Respondent gets

help with ADLs (Rw[adl]H, e.g., RwDRESSH) or uses equipment to walk across a room or get in and out of bed (RwWALKRE and RwBEDE).

Note that questions about using the toilet are not asked in Waves 1 and 2H. Thus there is no R1TOILT variable and for HRS Respondents in Wave 2, R2TOILT is set to .Q (question not asked). Questions about receiving help or using equipment are not asked in these waves for any of the ADLs. So in Wave 1, the variables R1[adl]H, R1WALKRE, or R1BEDE are not present, and for HRS Respondents in Wave 2H, the R2[adl]H, R2WALKRE, and R2BEDE variables are set to .Q.

The recodes vary across waves because the question and responses can vary across waves. In Wave 1, the HRS imputations are left in place. In all other waves "don't know" is recoded to special missing code .D and "refused" is recoded to .R. In Wave 1, difficulty with an ADL is rated on a 4-point scale from "no difficulty" to "very difficult/can't do." These are assigned without change. A "don't do" answer is recoded to "7."

In Wave 2, the question asks if the Respondent has any difficulty with an ADL and if so, asks follow-up questions about the degree of difficulty. In Wave 2H, the raw variable codes both questions as one categorical variable. In Wave 2A the answer to the first question and a categorical variable for the follow-up are given. In either case, a "no" answer to the first question about any difficulty is recoded to "0," and the categorical levels of difficulty are recoded appropriately to "a little" and "a lot," or "don't know/refused how much." A "don't do" response is coded as "7."

From Wave 3 forward, the answers are simply "yes" for difficulty and "no" if not, which are coded "1" and "0," respectively. A "can't do" response is recoded to "2" and a "don't do" response is recoded to "7."

In some waves, questions about activities are skipped based on answers to previous questions. In Waves 1 and 2H, if a Respondent said no difficulty jogging a mile, walking several blocks, or walking one block, the question about walking across a room is skipped. In these cases, RwWALKR is set to "0" for "no difficulty."

From Wave 3 forward, ADL questions are skipped if no difficulty was reported with any of the tasks asked about earlier. In these cases, Rw[adl] is set to .S for "skip." From Wave 4 forward, if difficulty with only one prior task and no difficulty with dressing was reported, the questions about the rest of the ADLs are skipped. In these cases, the rest of the Rw[adl] variables are also set to .S for "skip."

In Wave 2A and from Wave 3 forward, there are questions about getting help with all ADLs and about use of equipment for walking across a room and getting in and out of bed. The help variables are named Rw[adl]H, e.g., RwWALKRH and the equipment variables are named RwWALKRE and RwBEDE. These are coded "1" for yes, "0" for no, .D for "don't know," and .R for "refuse." If the Respondent reported "no difficulty," the help question is skipped, and the help variable (e.g., RwWALKRH) is set to "0" for "no help." The equipment question is asked regardless of the answer to the difficulty question. If the difficulty question is skipped because of previous answers, then both the help and equipment questions are also skipped and Rw[adl]H and RwWALKRE/RwBEDE are set to .S for "skip."

In Wave 2A, the question about getting help was asked before the one about difficulty and using equipment walking across a room. If Respondents answered "don't do" on the getting help question, then the R2[adl]H help variable is set to ".X" and, if applicable, the equipment variable (e.g., R2WALKRE and R2BEDE) is set to "7." In other waves, the question about help is asked even if the response to whether any difficulty is "don't do." In Wave 7, a mistake in the Spanish instrument allowed "can't do" and "don't do" responses for the help questions, and a few of these responses are given for all of the ADLs except help with dressing and eating.

In Wave 2H, the data needed to derive the help variables (R2[adl]H) and R2WALKRE/R2BEDE are not collected. R2[adl]H and R2WALKRE/R2BEDE are set to .Q to indicate that this information is not available for HRS Respondents in this wave.

The spouse variables are taken from the spouse's self-reported Wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

There are other versions of the Rw[adl] variables that recode to a yes/no measure for use in creating indices. One version of this variable is derived that attempts to code a consistent cross-wave yes/no dummy that indicates "any difficulty" (Rw[adl]A). These are available from Wave 2 forward. Because of the inconsistent coding of the underlying HRS data, we do not construct R1[adl]A variables in Wave 1. Please see the description of the Rw[adl]A variables under "Activities of daily living (ADLs): Any difficulty" for this version. Rw[adl]A variables are used to construct a number of functional limitation indices, including an ADL summary index.

Please see "ADL Summary" and "Other Summary Indices."

A third version of these variables are derived for Wave 1 only (R1[adl]W). They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper. These are provided for comparison to the results found in that paper. Please see "ADLs: Recodes for comparison to Wallace and Herzog" for a description of the R1[adl]W variables. Note that the Wallace and Herzog variables result in more limitation than the 0/1 recodes done in other waves (Rw[adl]A) solely due to measurement differences in the raw data. The R1[adl]W variables are not appropriate for comparison to the Rw[adl]A variables in other waves.

### **Exit Interview Variables**

These variables recode the raw variables for whether the Respondent received help with activities of daily living (ADLs) in the last three months of life. The ADLs include: help getting across a room (REWALKRH); dressing, including putting on shoes and socks (REDRESSH); bathing or showering (REBATHH); eating, such as cutting up food (REEATH); getting in or out of bed (REBEDH); and using the toilet, including getting up and down (RETOILTH).

When asked about whether the Respondent received help with ADLs, the proxy may reply that the Respondent couldn't do or didn't do the activity. A "couldn't do" response is set to "2" and a "didn't do" response is set to "7."

The questions about receiving help are not asked in Wave 2H. The variables RE[adl]H are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

If the Respondent was bedridden around their time of death, the ADL help questions are skipped and the variables RE[adl]H are set to .S for "skip." Bedridden is defined as spending more than half the day in bed for 86 or more days during the last three months before death. Please see "How Constructed" for REBEDRID for more information on bedridden status.

### **Core and Exit Differences**

The Core and Exit Interviews differ in what questions are asked, the values the variables can take, and the skip patterns that lead to certain questions.

The Core Interview asks questions about Respondents' difficulties with activities of daily living (ADLs), help received with ADLs, and equipment used to assist with ADLs (for walking and getting in and out of bed). The Exit Interview only asks questions about help that the Respondent received with ADLs.

Because the Exit Interview doesn't ask questions about difficulty with ADLs, the proxy may reply "couldn't do" and "didn't do" to the help with ADL questions. In the Core Interview the "can't do" and "don't do" responses are available during the difficulty questions, and the help with ADL variables are binary.

The Core Interview has different skip patterns to enter the ADL section depending on the wave. Please see above for specifics. In general, Respondents are asked a preliminary series of questions about difficulties with different physical tasks. If the Respondent reports difficulty with these tasks, they are asked the ADL questions. In the Exit Interview, if the Respondent was not bedridden around time of death, the ADL questions are asked.

Of special note, for the help with ADL questions, Core Respondents are only asked each help question if they report having difficulty with the associated ADL (so a Respondent who reports no difficulty walking across a room would not be asked who helps them walk across a room). Exit proxies are asked all six help with ADL questions unless the Respondent was bedridden around time of death.

### **Cross Wave Differences in Original HRS Data**

#### **Core Interview Variables**

Each wave has a series of questions about limits on activities of daily living (ADLs), but the ADLs, the question wording, and possible answers vary.

In all waves questions ask about a number of activities, such as climbing stairs or picking up a dime. In Wave 1 these include those identified as ADLs. The Wave 1 questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. ... Exclude any difficulties that you expect to last less than three months. How difficult is it for you to [...]? Is it not at all difficult, a little difficult, somewhat difficult, very difficult, or something that you can't do at all?"

The Respondent can also answer "don't do." The answers translate into 4 codes from 1 for "not at all difficult" to 4 for "very difficult/can't do." Another code is used for the "don't do" response. The specific wording for the ADLs is: walk across a room, get in and out of bed without help, bathe or shower without help, eat without help, and dress without help.

In Wave 2H the ADL questions continue to be embedded among other activities as in Wave 1, but the question and answers differ. The questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. Please tell me how difficult each of the following activities is for you. Exclude any difficulties that you expect to last less than three months. Do you have any difficulty with ...? [IF YES] Is that a little difficulty or a lot of difficulty?"

In the data the answers to the two-part question are recoded into 5-categories: 1=yes, a little difficult; 2=yes, a lot; 3=yes, DK; 4=yes, RF; 5=No; and 6=doesn't do. Note that there is no "can't do" category and that "don't do" is not an option in the instrument. The "doesn't do" category is likely the result of post-interview interpretation of interview comments so may be observed less frequently than in other waves, simply because of questionnaire differences. This does not appear to have a large impact among the ADLs. The specific wording for the ADLs is: walking across the room, getting in and out of bed without help, bathing or showering without help, eating without help, and dressing without help.

In Waves 1 and 2H, if the Respondent reported no difficulty with jogging a mile, walking several blocks, or walking one block, then the question about walking across the room is skipped.

In Wave 2A, the question asks:

"We need to understand difficulties people may have with various activities because of a health or physical problem. Please tell me whether you get help or have any difficulty doing each of the everyday activities. If you never do that activity, just tell me so. Does anyone ever help you ...? Yes, No or Don't do. [IF YES] Do you get help most of the time, some of the time, only occasionally?"

The exact wording for the ADLs in the help question is: get across a room; get in and out of bed; bathe or shower; dress, including putting on socks and shoes; eat, such as cutting up your food; and use the toilet, including getting up and down.

Regardless of whether any difficulty is reported for walking across the room: "Do you ever use equipment or devices such as a cane, walker or wheelchair when crossing a room?"

Regardless of whether any difficulty is reported for getting in and out of bed: "Do you ever use equipment or devices such as a rail, cane, walker, wheelchair or lift to help you get in and out of bed?"

For walking across a room and getting in and out of bed: "(Even when someone helps you/Even when using the (EQUIPMENT)/Without any help or special equipment) do you have any difficulty [...]? Yes or No. [if YES] Is that a lot or a little difficulty?" The exact wording for the task is: walking across the room and getting in and out of bed.

For other ADLs: "Do you have any difficulty [...] (even when someone helps you/without any help)? Yes or No. [if YES] Is that a lot or a little difficulty?" The exact wording for these tasks is: bathing, eating, dressing, and using the toilet.

Note that in Wave 2A, the question about getting help was asked before any difficulty and using equipment. If the Respondent answered "don't do" on the getting help question, then the questions on any difficulty and equipment are skipped. Note that there is no "can't do" category.

From Wave 3 forward, the questions about ADLs are removed from the initial list of activities. If the Respondent has no difficulty with any of these activities then the questions about ADLs are skipped. Questions ask about ADLs ONLY if the Respondent reported difficulty with some activity on the initial list. The questions on ADLs ask:

"Here are a few more everyday activities. Please tell me if you have any difficulty with these because of a physical, mental, emotional or memory problem. Again exclude any difficulties you expect to last less than three months. Because of a health or memory problem do you have any difficulty with ...?"

The answers to the difficulty questions are simply: yes, no, can't do, or don't do. The exact wording for the ADLs is: walking across a room; dressing, including putting on socks and shoes; bathing or showering; eating, such as cutting up your food; getting in and out of bed; and using the toilet, including getting up and down.

Regardless of whether any difficulty is reported for walking across the room: "Do you ever use equipment or devices such as a cane, walker or wheelchair when crossing a room? Yes or No."

Regardless of whether any difficulty is reported for getting in and out of bed: "Do you ever use equipment or devices such as a cane, walker or railing when getting in or out of bed? Yes or No."

Unless the Respondent reports having no difficulty with an ADL, then they are asked:

"Does anyone ever help you [...]? Yes or No." The exact wording for each of the ADLs is: get across a room, dress, bathe, eat, get in or out of bed, and use the toilet.

From Wave 4 forward, the question organization and wording are the same as in Wave 3, with one exception. If the first basic ADL, dressing, showed no difficulty, and among the prior tasks at most one difficulty was reported, the rest of the basic ADLs of walking across a room, bathing, eating, getting in/out of bed, and using the toilet were skipped.

In Wave 7, a mistake in the Spanish instrument allowed "can't do" and "don't do" responses for the help questions, and a few of these responses are given for all of the ADLs except help with dressing and eating.

In Wave 15, some respondents were incorrectly not asked the ADL difficulty and help questions. The HRS produced imputations for the ADL difficulty variables for 1,308 Respondents and that data is incorporated into this file. The variable RADLIMP variable on the raw file indicates which records received imputed data. Note that the help questions were not imputed and are set to .M if missing.

For HRS Respondents in Waves 1 and 2H, the information for the equipment and help questions is not available. For Wave 2H, R2WALKRE, R2BEDE, R2WALKRH, are set to .Q and only Wave 2A Respondents have non-missing values for these variables. Also not asked in Waves 1 and 2H are all the questions about using the toilet, so for Wave 2H, R2TOILT and R2TOILTH are set to .Q.

## Exit Interview Variables

In Exit Interview Wave 2H, proxies are not asked questions about whether Respondents received help with ADLs; therefore, all RE[adl]H variables are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

### Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
REWALKRT	4972	12.89	39.02	0.0	1118.0
REDRESST	6188	13.42	36.97	0.0	1083.0
REBATHT	6618	14.88	35.70	0.0	1129.0
REEATT	4168	9.93	24.92	0.0	593.0
REBEDT	5351	9.75	26.62	0.0	1028.0
RETOILTT	5175	10.86	38.53	0.0	1188.0

### How Constructed

These variables indicate the amount of time, in months, that the Respondent was helped with activities of daily living (ADLs) prior to death. The ADLs include time helped walking across a room (REWALKRT), dressing (REDRESST), bathing (REBATHT), eating (REEATT), getting in and out of bed (REBEDT), and using the toilet (RETOILTT).

Proxies are asked how long the Respondent needed help with an ADL if the Respondent received help for that ADL in their last three months of life, or if the Respondent couldn't do or didn't do that ADL.

Proxies who answer the amount of time question can answer in 4 different ways. Responses can be of the form (1) Number of Months Helped; (2) Number of Years Helped; (3) Age Received Help Since; (4) Year Received Help Since. The variables RE[adl]T are reported in number of months. If the proxy reports Number of Months, this value is used. If the proxy reports Number of Years, this value divided by 12 is used.

If the proxy reports "since age," the date started receiving help is calculated as the day the Respondent turned that age. If the proxy reports "since year," the date started receiving help is calculated as January 1 of that year. These dates are then compared to the death date of the Respondent.

Through this calculation, there were a small but non-trivial number of observations with negative number of months helped. This happened if, for example, the proxy was interviewed in 2010 and responded "He needed help since 2009" but the Respondent had died in October of 2008. Observations that would have a negative value given their Since Age or Since Year answers are instead set to .A.

If the proxy didn't report that the Respondent had difficulty with, didn't do or couldn't do the corresponding ADL, the ADL time question is skipped and the variable RE[adl]T is set to .S.

The questions about length of time needing help are not asked in Wave 2H. The variables RE[adl]T are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

## Cross Wave Differences in Original HRS Data

In Wave 2H, proxies are not asked questions about length of time Respondents needed help with ADLs; therefore, RE[adl]T variables are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

## How Constructed

These variables recode raw data about difficulty with activities of daily living (ADLs) as yes/no dummy variables, where "1" means any difficulty and "0" means "no difficulty." The ADLs include walking across a room (RwWALKRA), dressing (RwDRESSA), bathing (RwBATHA), eating (RwEATA), getting in and out of bed (RwBEDA), and using the toilet (RwTOILTA). In the following, references to Rw[adl]A apply to all these variables. Note that questions about using the toilet were not asked in Wave 2H. For HRS Respondents in Wave 2H, R2TOILTA is set to .Q (question not asked).

We attempt to make consistent variables across waves. Because of significant differences in question wording in Wave 1, we do

not include these variables for this interview year. There are other cross wave differences in the way HRS presented these questions in Waves 2H and 2A and the later waves that may introduce measurement errors in these variables. In addition, the criteria used for skipping some questions changed between Wave 3 and later waves, which may also influence the consistency of measurement before Wave 4 for all ADLs except dressing.

The variable derivations for any difficulty with ADLs (Rw[adl]A) vary across waves because the question and responses can vary across waves. In Wave 2, if a Respondent answers "yes" to the first question ("Do you have any difficulty with ...") Rw[adl]A is set to "1" for "any difficulty," regardless of how much difficulty the Respondent says they have in the follow-up question. From Wave 3 forward, if a Respondent answers "yes" or "can't do" to the "any difficulty" question, Rw[adl]A is set to "1" for "any difficulty."

In all waves, if the Respondent answers "no" to the any difficulty question, Rw[adl]A is set to "0." A "don't do" response is recoded to missing value .X, since the Respondent hasn't revealed whether they would have difficulty with the activity if they ever did it. If the response is "don't know" or "refuse," Rw[adl]A is set to special missing codes .D or .R, respectively.

In some waves, questions about activities are skipped based on answers to previous questions. In Wave 2H, if a Respondent said no difficulty jogging a mile, walking several blocks, or walking one block, the question about walking across a room is skipped. In these cases, R2WALKRA is set to "0" for "no difficulty." This does not apply to Wave 2A.

From Wave 3 forward, ADL questions are skipped if no difficulty was reported with any of the tasks asked about earlier. In these cases, Rw[adl]A is set to "0" for "no difficulty." From Wave 4 forward, if difficulty with only one prior task and no difficulty with dressing was reported, the questions about the rest of the ADLs are skipped. In these cases, the rest of the Rw[adl]A variables are also set to "no difficulty." The assumption is that, since the Respondent had no difficulty with the earlier activities, they would also have reported no difficulty to the activities in the skipped questions.

In Wave 2A and from Wave 3 forward, there are questions about getting help with all ADLs. For waves when the help question is asked, we set Rw[adl]A to "1" for "yes" if Respondents answer "yes" to getting help and are missing Rw[adl]A, i.e., the response to the any difficulty question is "don't do," "don't know," or "refuse." All "can't do" responses are coded as "yes" regardless of whether or not they report receiving help.

The spouse variables are taken from the spouse's self-reported Wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

Some of these variables are used to construct a number of functional limitation indices, including an ADL summary index. Please see "ADL Summary" and "Other Summary Indices."

Another version of these variables simply recode the raw HRS variables. Please see the description of the Rw[adl] variables under "Activities of Daily Living (ADLs): Raw recodes" for this version.

A third version of ADL variables are derived for Wave 1 only (R1[adl]W). They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper. These are provided for comparison to the results found in that paper. Please see "ADLs: Recodes for comparison to Wallace and Herzog" for a description of the R1[adl]W variables. Note that the Wallace and Herzog variables result in more limitation than the 0/1 recodes described here for other waves (Rw[adl]A) solely due to measurement differences in the raw data. The R1[adl]W variables are not appropriate for comparison to the Rw[adl]A variables in other waves.

## **Cross Wave Differences in Original HRS Data**

Each wave has a series of questions about limits on activities of daily living (ADLs), but the ADLs, the question wording, and possible answers vary.

In all waves questions ask about a number of activities, such as climbing stairs or picking up a dime. In Wave 1 these include those identified as ADLs. The Wave 1 questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. ... Exclude any difficulties that you expect to last less than three months. How difficult is it for you to [...]? Is it not at all difficult, a little difficult, somewhat difficult, very difficult, or something that you can't do at all?"

The Respondent can also answer "don't do." The answers translate into 4 codes from "1" for "not at all difficult" to "4" for "very difficult/can't do." Another code is used for the "don't do" response. The specific wording for the ADLs is: walk across a room, get in and out of bed without help, bathe or shower without help, eat without help, and dress without help.

In Wave 2H the ADL questions continue to be embedded among other activities as in Wave 1 but the question and answers differ. The questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. Please tell me how difficult each of the following activities is for you. Exclude any difficulties that you expect to last less than three months. Do you have any difficulty with ...? [IF YES] Is that a little difficulty or a lot of difficulty?"

In the data the answers to the two-part question are recoded into 5-categories: 1=yes, a little difficult; 2=yes, a lot; 3=yes, DK; 4=yes, RF; 5=No; 6=doesn't do. Note that there is no "Can't do" category and that "don't do" is not an option in the instrument. The "Doesn't do" category is likely the result of post-interview interpretation of interview comments, so may be observed less frequently than in other waves, simply because of questionnaire differences. This does not appear to have a large impact among the ADLs. The specific wording for the ADLs is: walking across the room, getting in and out of bed without help, bathing or showering without help, eating without help, and dressing without help.

In Waves 1 and 2H, if the Respondent reported no difficulty with jogging a mile, walking several blocks, or walking one block, then the question about walking across the room is skipped.

In Wave 2A, the question asks:

"We need to understand difficulties people may have with various activities because of a health or physical problem. Please tell me whether you get help or have any difficulty doing each of the everyday activities. If you never do that activity, just tell me so. Does anyone ever help you ...? Yes, No or Don't do. [IF YES] Do you get help most of the time, some of the time, only occasionally?"

The exact wording for the ADLs in the help question is: get across a room; get in and out of bed; bathe or shower; dress, including putting on socks and shoes; eat, such as cutting up your food; and use the toilet, including getting up and down.

Regardless of whether any difficulty is reported for walking across the room: "Do you ever use equipment or devices such as a cane, walker or wheelchair when crossing a room?"

Regardless of whether any difficulty is reported for getting in and out of bed: "Do you ever use equipment or devices such as a rail, cane, walker, wheelchair or lift to help you get in and out of bed?"

For walking across a room and getting in and out of bed: "(Even when someone helps you/Even when using the (EQUIPMENT)/Without any help or special equipment) do you have any difficulty [...]? Yes or No. [if YES] Is that a lot or a little difficulty? The exact wording for the task is: walking across the room and getting in and out of bed."

For other ADLs: "Do you have any difficulty [...] (even when someone helps you/without any help)? Yes or No. [if YES] Is that a lot or a little difficulty? The exact wording for these tasks is: bathing, eating, dressing, and using the toilet."

Note that in Wave 2A, the question about getting help was asked before any difficulty and using equipment. So if the Respondent answered "don't do" on the getting help question, then the questions on any difficulty and equipment are skipped. Note that there is no "Can't do" category.

From Wave 3 forward, the questions about ADLs are removed from the initial list of activities. If the Respondent has no difficulty with any of these activities then the questions about ADLs are skipped. Questions ask about ADLs ONLY if the Respondent reported difficulty with some activity on the initial list. The questions on ADLs ask:

"Here are a few more everyday activities. Please tell me if you have any difficulty with these because of a physical, mental, emotional or memory problem. Again exclude any difficulties you expect to last less than three months. Because of a health or memory problem do you have any difficulty with ...?"

The answers to the difficulty questions are simply "yes," "no," "can't do," or "don't do." The exact wording for the ADLs is: walking across a room; dressing, including putting on socks and shoes; bathing or showering; eating, such as cutting up your food; getting in and out of bed; and using the toilet, including getting up and down.

Regardless of whether any difficulty is reported for walking across the room: "Do you ever use equipment or devices such as a cane, walker or wheelchair when crossing a room? Yes or No."

Regardless of whether any difficulty is reported for getting in and out of bed: "Do you ever use equipment or devices such as a cane, walker or railing when getting in or out of bed? Yes or No."

Unless the Respondent reports having no difficulty with an ADL then they are asked:

"Does anyone ever help you [...]? Yes or No." The exact wording for each of the ADLs is: get across a room, dress, bathe, eat, get in or out of bed, and use the toilet.

From Wave 4 forward, the question organization and wording are the same as in Wave 3, with one exception. If the first basic ADL, dressing, showed no difficulty, and among the prior tasks at most one difficulty was reported, the rest of the basic ADLs of walking across a room, bathing, eating, getting in/out of bed, and using the toilet were skipped.

In Wave 7, a mistake in the Spanish instrument allowed "can't do" and "don't do" responses for the help questions, and a few of these responses are given for all of the ADLs except help with dressing and eating.

In Wave 15, some respondents were incorrectly not asked the ADL difficulty and help questions. The HRS produced imputations for the ADL difficulty variables for 1,308 Respondents and that data is incorporated into this file. The variable RADLIMP variable on the raw file indicates which records received imputed data. Note that the help questions were not imputed and are set to .M if missing.

In Waves 1 and 2H, questions about using the toilet are not asked, so for Wave 2H, R2TOILTA is set to .Q.

## How Constructed

These ADL variables are derived for Wave 1 only. They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper (Wallace and Herzog, 1995). These variables are provided for comparison to the results found in that paper.

Wallace and Herzog recode the ADL variables to 1 for "any difficulty" if the Respondent answered "a little difficult," "somewhat difficult" or "very difficult/can't do." A response of "not difficult at all" is recoded to zero. This recoding scheme is applied for these variables to attempt to replicate the results reported in their paper.

If a Respondent said no difficulty jogging a mile, walking several blocks, or walking one block, the RwwALKRW variable is set to "0" for "no difficulty."

The spouse variables are taken from the spouse's self-reported Wave 1 data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

There are several other versions of these variables. One version simply recodes the raw HRS variables. Please see the descriptions of these (RwwALKR, RwdRESS, RweAT, RwbED, RwbATH) under "Activities of Daily Living (ADLs): Raw recodes."

Another version recodes a yes/no dummy variable in waves other than Wave 1, but these are not comparable with the Wallace and Herzog recodes. Please see the descriptions of these (RwwALKRA, RwdRESSA, RweATA, RwbEDA, RwbATHA) under "Activities of Daily Living (ADLs): Any difficulty."

Some of the Wallace and Herzog indices are also derived and include some of these measures in creating an index. Please see "ADL Summary" and "Other Summary Indices."

## Cross Wave Differences in Original HRS Data

Each wave has a series of questions about limits on activities of daily living (ADLs), but the ADLs, the question wording, and possible answers vary.

In all waves questions ask about a number of activities, such as climbing stairs or picking up a dime. In Wave 1 these include

those identified as ADLs. The Wave 1 questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. ... Exclude any difficulties that you expect to last less than three months. How difficult is it for you to [...]? Is it not at all difficult, a little difficult, somewhat difficult, very difficult, or something that you can't do at all?"

The Respondent can also answer "Don't do." The answers translate into 4 codes from 1 for "not at all difficult" to 4 for "very difficult/can't do." Another code is used for the "Don't do" response.

In subsequent waves, there is a question that simply asks if the Respondent has any difficulty with a particular activity. The question wording and possible answers are sufficiently different that the levels of Wave 1 codes cannot be derived from the data.

## How Constructed

### Core Interview Variables

These variables recode the raw variables for difficulty with instrumental activities of daily living (IADLs) as they appear in the HRS data except for missing values and accounting for skip patterns. Some measures described here are not normally used as IADLs but are included with them because they seemed to serve a similar measurement function in Wave 1. The measures described here are using the phone (RwPHONE), taking medications (RwMEDS), managing money (RwMONEY), shopping for groceries (RwSHOP), preparing meals (RwMEALS), using a map (RwMAP), using a calculator (RwCALC), using a microwave (R1MCWV), and using a computer (R1COMP). In the following, references to Rw[iadl] apply to all these variables.

Respondents are asked about different IADL activities in Waves 1 and 2 than in the rest of the waves. Wave 1 asks about using a map, a calculator, a microwave, and a computer, but not about preparing meals, shopping for groceries, using the phone, taking medications, or managing money, which are activities normally considered IADLs. From Wave 2 forward, the questions about using a microwave or a computer are dropped, but using the phone, taking medications, and managing money are added. In Wave 2A and from Wave 3 forward, the questions about using a calculator are not asked, but shopping for groceries and preparing meals are added. Using a map is asked in all waves except Wave 2A. From Wave 3 forward, the set of IADLs is consistent and includes using the phone, taking medications, managing money, shopping for groceries, preparing meals, and using a map.

In Wave 2A and 2H, the questions are asked differently and result in different raw recodes. The Wave 2H variables are named as they are in other waves (R2[iadl], e.g., R2PHONE) and the Wave 2A variables recoded raw variables are named R2[iadl]R, e.g., R2PHONER. For HRS Respondents in Wave 2, the R2[iadl]R variables are set to .Q, and similarly, for AHEAD Respondents in Wave 2, the R2[iadl] variables are set to .Q.

To summarize, R1MCWV and R1COMP are available only in Wave 1; RwCALC is only available in Waves 1 and 2H; R2PHONE, R2MEDS, and R2MONEY are available for Wave 2H; R2PHONER, R2MEDSR, R2MONEYR, R2SHOPR, and R2MEALSR are available for Wave 2A; RwPHONE, RwMEDS, RwMONEY, RwSHOP and RwMEALS are available from Wave 3 forward; and RwMAP is available in all waves except Wave 2A.

In addition the categories for Rw[iadl] variables are uniquely different from other waves in Waves 1, 2H, and 2A.

The recodes vary across waves because the question and responses can vary across waves. In Wave 1, the HRS imputations are left in place. In all other waves don't know is recoded to special missing code .D and refused is recoded to .R.

In Wave 1 difficulty with an ADL is rated on a 4-point scale from no difficulty to very difficult/can't do. These are assigned without change. A "don't do" answer is recoded to "7."

In Wave 2H, the question asks if the Respondent has any difficulty with an IADL and if so, asks follow-up questions about the

degree of difficulty. The raw variable codes both questions as one categorical variable. A "no" answer to the first question about any difficulty is recoded to "0" and the categorical levels of difficulty are recoded appropriately to "yes, a little," "yes, a lot," "yes, don't know how much," or "yes, refused how much." A "don't do" response is coded as "7."

In Wave 2A, except for managing money, the questions begin with "Are you able to do ... without help?" If the response is "don't do" then a follow-up question asks if this is because of a health problem. If the response to the first question is yes, then R2[iadl]R is set to "0," able to do without help. If the response is no, i.e., not able to do without help, R2[iadl]R is set to "1," unable to do without help. If the Respondent indicates that they don't do the activity because of a health problem, R2[iadl]R is set to "2" for can't do. If it is not because of a health problem, R2[iadl]R is set to "7," doesn't do. The follow-up question about any difficulty was asked for these IADLS as a group, i.e., preparing meals, shopping for groceries, making telephone calls and taking medications all together. Because it is impossible to separate answers for specific IADLS, we don't use this question.

For managing money in Wave 2A, the initial question asks about being able to manage money without help. If the response is no, a follow-up question asks if this is because of a health problem. If the response to the first question is yes, then R2MONEYR is set to "0," able to do without help. If the response is no, and the Respondent indicates that it is because of a health problem, then R2MONEYR is set to "1," unable to do without help. If not because of a health problem then R2MONEYR is set to "7," doesn't do.

From Wave 3 forward there is just one question about difficulty using a map. RwMAP is set to "1" for any difficulty (yes), "0" for "no difficulty," "2" for "can't do," "7" for "don't do," .D for don't know, .R for refuse, and .S if the question was not asked.

From Wave 3 forward for other activities, follow-up questions for "can't do" or "don't do" responses are used in deriving Rw[iadl]. Except for taking medications from Wave 4 forward, Rw[iadl] is derived as follows. If the Respondent answers yes or no to the first question about having any difficulty, then Rw[iadl] is set to "1" for yes, difficulty or "0" for no difficulty, respectively. A don't know or refuse response is set to .D or .R, respectively, and if the question is not answered, Rw[iadl] is set to .S.

From Wave 4 forward for taking medications, the recoding uses three questions. If the Respondent answers yes to the first question about having any difficulty, RwMEDS is set to "1" for "any difficulty." If the answer is no, RwMEDS is set to "0" for "no difficulty." A "don't know" or "refuse" response is set to .D or .R, respectively, and if the question is not answered, Rw[iadl] is set to .S.

If the Respondent answers "don't do" to the first question, a second question asks if they would have difficulty if they took medications. If the answer is no, then RwMEDS is set to .Z to indicate the Respondent doesn't take medications but says they wouldn't have difficulty if they did.

If the answer to the second question is yes or if the Respondent answers "can't do" to the first question, a third question asks whether it is because of a health problem. If the answer is "yes" and the Respondent said "can't do" to the first question, RwMEDS is set to "2" for "can't do." If the answer is "yes" and the Respondent doesn't take medications but said they would have difficulty if they did, RwMEDS is set to "1" for "yes, difficulty." If the answer is "no" it is considered a "don't do" response.

From Wave 3 forward, there are questions about getting help with all IADLS except reading a map (RwMAP). The help variables are named Rw[iadl]H, e.g., RwPHONEH, RwMEDSH, RwMONEYH, RwSHOPH, and RwMEALSH. These are coded "1" for "yes," "0" for "no," .D for "don't know," and .R for "refuse." If the Respondent reported "no difficulty," the help question is skipped, and the help variable (e.g., RwPHONEH) is set to "0" for "no help." If the Respondent reported "don't do" for RwMEDS but also that they would not have difficulty if they did per the medication difficulty follow-up question (i.e. RwMEDS=.Z=Don't do/No if did), RwMEDSH is imputed to "0" for "no help." If the Respondent is in a nursing home, the question about getting help with meals, meds, and shopping are skipped. In these cases, RwMEDSH, RwSHOPH, and RwMEALSH are set to "1" for "yes."

In Wave 2A, the question about getting help is posed differently and in Wave 2H, the data needed to derive the help variables are not collected. Therefore, the Wave 2 IADL help variables(R2[iadl]H) are not available.

The spouse variables are taken from the spouse's self-reported Wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond then the variables are set to .V=Spouse is non-response.

There are other versions of the Rw[iadl] variables that recode to a yes/no measure for use in creating indices. One version of this variable is derived that attempts to code a consistent cross-wave yes/no dummy that indicates "any difficulty" (Rw[iadl]A). These

are available from Wave 2 forward. Because of the inconsistent coding of the underlying HRS data, we do not construct R1[iadl]A variables in Wave 1. Please see the description of the Rw[iadl]A variables under "Instrumental activities of daily living (IADLs): Any difficulty" for this version. Rw[iadl]A variables are used to construct an IADL summary index. Please see "IADL Summary."

A third version of these variables are derived for Wave 1 only (R1[iadl]W). They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper. These are provided for comparison to the results found in that paper. Please see "IADLs: Recodes for comparison to Wallace and Herzog" for a description of the R1MAPW, R1CALCW, R1MCWVW, and R1COMPW variables. Note that the Wallace and Herzog variables result in more limitation than the 0/1 recodes done in other waves (Rw[iadl]A) solely due to measurement differences in the raw data. The R1[iadl]W variables are not appropriate for comparison to the Rw[iadl]A variables in other waves.

### Exit Interview Variables

These variables recode the raw variables for whether the Respondent received help with instrumental activities of daily living (IADLs) in the last three months of life. The IADLs include help preparing hot meals (REMEALSH), shopping for groceries (RESHOPH), using the phone (REPHONEH), taking medication (REMEDSH), and managing money (REMONEYH).

When asked about whether the Respondent received help with ADLs, the proxy may reply that the Respondent couldn't do or didn't do the activity. A "couldn't do" response is set to 2 and a "didn't do" response is set to "7."

The questions about receiving help are not asked in Wave 2H. The variables RE[iadl]H are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

If the Respondent was living in a nursing home at the time of their death the IADL help questions are skipped and the variables RE[iadl]H are set to .S. From Waves 3 to 5, if the Respondent was bedridden around their time of death, the IADL help questions are skipped and the variables RE[iadl]H are set to .S. Bedridden is defined as spending 86 or more days in bed for more than half the day during the last three months before death. Please see "How Constructed" for REBEDRID for more information on bedridden status.

The exact wording for the IADLs in the help question is: preparing a hot meal; shopping for groceries; making phone calls; taking medications; managing your money - such as paying your bills and keeping track of expenses.

## Cross Wave Differences in Original HRS Data

### Core Interview Variables

Each wave has a series of questions about limits on instrumental activities of daily living (IADLs), but the specific activities, the question wording, and possible answers vary across waves. Some measures described here are not normally used as IADLs but are included with them because they seemed to serve a similar measurement function in Wave 1. The IADL measures described here are: using the phone (RwPHONE), taking medications (RwMEDS), managing money (RwMONEY), shopping for groceries (RwSHOP), preparing meals (RwMEALS), using a map (RwMAP), using a calculator (RwCALC), using a microwave (R1MCWV), and using a computer (R1COMP).

Respondents are asked about different IADL activities in Waves 1 and 2 than in the rest of the waves. Wave 1 asks about using a map, a calculator, a microwave, and a computer, but not about preparing meals, shopping for groceries, using the phone, taking medications, or managing money, which are activities normally considered IADLs. From Wave 2 forward, the questions about using a microwave or a computer are dropped, but using the phone, taking medications, and managing money are added. In Wave 2A and from Wave 3 forward, the questions about using a calculator are not asked, but shopping for groceries and preparing meals are added. Using a map is asked in all waves except Wave 2A. From Wave 3 forward, the set of IADLs is consistent and includes using the phone, taking medications, managing money, shopping for groceries, preparing meals, and using a map.

The question wording and answers also varied across waves. The Wave 1 questions ask:

"Here are some other activities that people may have difficulty with. How difficult is it for you to [...]?"

The Respondent can answer "not at all difficult," "a little difficult," "somewhat difficult," "very difficult/can't do," or "don't do." The answers translate into 4 codes from 1 for "not at all difficult" to 4 for "very difficult/can't do." Another code is used for the "don't do" response. The specific wording for the IADLs is: use a map to figure out how to get around a strange place, use a microwave oven after reading the instructions, use a calculator to help balance your checkbook, and use a computer or word processor.

In Wave 2H the question wording is similar to that in Wave 1 but is asked in 2 parts:

1) "Here are some other activities that people may have difficulty with. Do you have any difficulty with ...?" The Respondent can answer "yes" or "no."

2) [IF YES] "Is that a little difficulty or a lot of difficulty?"

In the data the answers to the two-part question are recoded into 5-categories: 1=yes, a little difficult; 2=yes, a lot; 3=yes, DK; 4=yes, RF; 5=No; 6=doesn't do. Note that there is no "Can't do" category and that "Don't do" is not an option in the instrument. The "doesn't do" category is likely the result of post-interview interpretation of interview comments, therefore are observed less frequently than in other waves, simply because of questionnaire differences. This difference is considerable among the IADLs. The specific wording for the IADLs is: using a map to figure out how to get around a strange place, using a calculator to help balance your checkbook, managing your money, making telephone calls, and following instructions for taking prescription medications.

In Wave 2A, the questions are asked differently for managing money and for other IADLs. The section is prefaced with the following:

"Here are a few other daily activities which some people have difficulty with. Please tell me whether you are able to do each activity without help from anyone else. If you don't do the activity at all, just tell me so."

Except for managing money, the IADL questions ask:

"Are you able to ... without help? [IF DON'T DO] Is that because of a health problem?"

If the Respondent reports being able to do any one of these activities without help, a question asks:

"Without help do you have any difficulty with [list of all applicable IADLs]?" [IF YES] "Is that a little or a lot of difficulty?"

The specific wording for these activities is: prepare(ing) hot meals, shop(ping) for groceries, make(ing) telephone calls, and take(ing) medications.

For managing money the Wave 2A questions ask:

1) "Do you manage your money-such as paying your bills and keeping track of expenses, without anyone's help?"

2) [IF NO] "Is that because of a health or memory condition?"

3) [IF YES, DK, or RF to Q1, or YES to Q2] "Do you have any difficulty managing your money (when someone is helping you/without help)?"

4) [IF YES to Q3] "Is that a little or a lot of difficulty?"

From Wave 3 forward, the question wording is again similar to that in Wave 1, but is prefaced with additional text. The question asks:

"Here are a few other activities which some people have difficulty with because of a physical, mental, emotional, or memory problem. Please tell me if you have any difficulty with each activity I name. If you don't do the activity at all, just tell me so. Exclude any difficulties you expect to last less than three months."

For using a map the question in Wave 3 is: "Do you have any difficulty using a map to figure out how to get around in a strange place?" From Wave 4 forward, this is prefaced with "Because of a health or memory problem...." Responses may be "yes," "no," "can't do," or "don't do."

For other IADLs, a series of questions may be asked:

- 1) "Because of a health or memory problem do you have any difficulty with ...?" The Respondent can answer "yes," "no," "can't do," or "don't do." In Wave 3, for taking medications, the wording for "don't do" is "don't take medications."
- 2) For taking medications, from Wave 4 forward, [If DON'T DO to Q1] "Do you think you would have any difficulty taking medications if you needed to do so?"
- 3) [If YES, DK, or RF to Q2 for taking medications from Wave 4 forward; CAN'T DO to Q1 for taking medications in Wave 3; or CAN'T DO or DON'T DO to Q1 for all other activities] "Is that because of a health or memory problem?" The Respondent can answer "yes" or "no." In Wave 3A, this question is also asked if the response to Q1 is "don't know" or "refuse." In Wave 3A and 3H, this question is skipped for a "don't take medications" response. From Wave 4 forward, whether the question is asked depends on the answer to Q2 for taking medications if Q1 had a "don't do" response.
- 4) [If YES, DK, or RF to Q1 or Q3] "Does anyone help you ...?" The Respondent can answer "yes" or "no." In Wave 3, this question is not asked for managing money when the Q1 response is DK or RF. From Wave 4 forward this question is not asked if the Respondent is living in a nursing home. In Wave 7, a mistake in the Spanish instrument allowed "can't do" and "don't do" responses for the help questions, and a few of these responses are given for all of the IADLs except help with medications and money.

The specific wording for these activities is: prepare(ing) a hot meal, shop(ping) for groceries, make(ing) phone calls, take(ing) medications, and manage(ing) your money – such as paying your bills and keeping track of expenses.

### Exit Interview Variables

From Waves 3 to 5, these questions are skipped in the survey if the Respondent was bedridden around their time of death. From Wave 6 forward, these questions are asked even if the Respondent was bedridden around their time of death.

E	REMEDST	REMEDST:EXIT Time R got help-Take medications	Cont

### Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
REMEALST	5015	27.42	88.15	-292.0	1158.0
RESHOPT	5323	26.64	66.04	-4.0	1104.0
REPHONET	5685	20.95	61.33	-9.0	1134.0
REMEDST	5396	18.02	45.61	-360.0	1128.0

### How Constructed

These variables indicate the amount of time, in months, that the Respondent was helped with instrumental activities of daily living (IADLs) prior to death. The IADLs include help preparing hot meals (REMEALSH), shopping for groceries (RESHOPH), using the phone (REPHONEH), taking medication (REMEDSH), and managing money (REMONEYH).

The proxy is asked how long the Respondent needed help with an IADL if the Respondent received help for that ADL in their last three months of life, or if the Respondent couldn't do or didn't do that IADL.

Proxies who answer the amount of time question can answer in 4 different ways. Responses can be of the form (1) Number of Months Helped; (2) Number of Years Helped; (3) Age Received Help Since; (4) Year Received Help Since. The variables RE[iadl]T are reported in number of months. If the proxy reports Number of Months, this value is used. If the proxy reports Number of Years, this value divided by 12 is used.

If the proxy reports Since Age, the date started receiving help is calculated as the day the Respondent turned that age. If the proxy reports Since Year, the date started receiving help is calculated as January 1 of that year. These dates are then compared to the death date of the Respondent.

If the proxy didn't report that the Respondent had difficulty with, didn't do or couldn't do the corresponding IADL, the IADL time question is skipped and the variable RE[iadl]T is set to .S.

The questions about length of time needing help are not asked in Wave 2H. The variables RE[iadl]T are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

### Cross Wave Differences in Original HRS Data

In Wave 2H, proxies are not asked questions about length of time Respondents needed help with IADLs; therefore, RE[iadl]T variables are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

## How Constructed

Each wave has a series of questions about limits on instrumental activities of daily living (IADLs), but the specific activities, the question wording, and possible answers vary across waves. These variables recode the raw variables for difficulty with instrumental activities of daily living (IADLs) as yes/no dummy variables, where "1" means "any difficulty" and "0" means "no difficulty." Some measures described here are not normally used as IADLs but are included with them because they seemed to serve a similar measurement function in Wave 1. The measures described here are using the phone (RwPHONEA), taking medications (RwMEDSA), managing money (RwMONEYA), shopping for groceries (RwSHOPA), preparing meals (RwMEALSA), using a map (RwMAPA), and using a calculator (RwCALCA). In the following, references to Rw[iadl]A apply to all these variables.

Respondents are asked about different IADL activities in Waves 1 and 2 than in the rest of the waves. Wave 1 asks about using a map, a calculator, a microwave, and a computer, but not about preparing meals, shopping for groceries, using the phone, taking medications, or managing money, which are activities normally considered IADLs. From Wave 2 forward, the questions about using a microwave or a computer are dropped, but using the phone, taking medications, and managing money are added. In Wave 2A and from Wave 3 forward, the questions about using a calculator are not asked, but shopping for groceries and preparing meals are added. Using a map is asked in all waves except Wave 2A. From Wave 3 forward, the set of IADLs is consistent and includes using the phone, taking medications, managing money, shopping for groceries, preparing meals, and using a map.

We attempt to make consistent variables across waves. Because of significant differences in question wording in Wave 1, we do not include these variables for this interview year. There are other cross wave differences in the way HRS presented these questions in Waves 2H and 2A and the later waves that may introduce measurement errors in these variables. For example, in Wave 2H, "don't do" is not presented as an option in the instrument, and there are noticeably fewer "don't do" answers in this wave. Also "can't do" is not allowed as an answer in Wave 2H. In Wave 2A, the questions are based on whether the IADL can be done without help, and not specifically whether the Respondent has difficulty with it. In addition there is a slight difference in the question wording for using a map, and a difference in the questions for taking any medications between Wave 3 and later waves. The questions, and therefore, consistency, is much better from Wave 4 forward.

The variable derivations for any difficulty with IADLs (Rw[iadl]A) vary across waves because the question and responses can

vary across waves. In all waves, a "don't know" or "refuse" answer to the first question is set to .D or .R, respectively. Generally a "1" indicates "any difficulty or can't do," "0" indicates "no difficulty" and "don't do" is set to special missing code .X, since the Respondent hasn't revealed whether they would have difficulty with the activity if they ever did it.

In Wave 2H, if a Respondent answers "yes" to the first question ("Do you have any difficulty with ...") R2[iadl]A is set to "1" for "any difficulty," regardless of how much difficulty the Respondent says they have in the follow-up question. The questions about shopping and preparing meals were not asked in this wave, so R2SHOPA and R2MEALSA are set to .Q for HRS Respondents in Wave 2.

In Wave 2A, the questions ask if the Respondent is able to do an activity without help. If the Respondent says they don't do the activity then a question asks if this is because of a health problem. Another question about difficulty groups shopping, preparing meals, taking medications, and using the phone together in one question. Because it is impossible to separate answers for specific IADLs, we don't use this question. So if the answer to the first question about doing an activity without help is "no," R2[iadl]A is set to "1," for "any difficulty," and if the answer is "yes," i.e., able to do without help, R2[iadl]A is set to "0," for "no difficulty." If the answer is "don't do" and it is because of a health problem, we set R2[iadl]A to "1" for "any difficulty." Otherwise a "don't do" response is set to .X.

For managing money in Wave 2A, "don't do" is not a possible answer, but those who respond "no" to the first question are asked if it is because of a health problem. In this case, if the Respondent is unable to manage money because of a health problem, R2MONEYA is set to "1" for "any difficulty." If unable to manage money, but not because of a health problem, R2MONEYA is set to .X for "don't do." If the Respondent is able to manage money without help, then R2MONEYA is set to "0" for "no difficulty." In Wave 2A, questions about using a map and using a calculator are not asked, so R2MAPA and R2CALCA are set to .Q for AHEAD Respondents in Wave 2.

For using a map, from Wave 3 forward, if a Respondent answers "yes" or "can't do" to a question asking if they have any difficulty, Rw[iadl]A is set to "1" for "any difficulty." If the answer is "no," Rw[iadl]A is set to "0," and if the answer is "don't do," Rw[iadl]A is set to .X.

For taking medications, the questions are different in Wave 3 than for later waves. In Wave 3, if the answer to the first question about any difficulty is "no" or "yes," then R3MEDSA is set to "0" for "no difficulty" or "1" for "any difficulty," respectively. If the answer is "can't do" and it is because of a health problem, then R3MEDSA is set to "1" for "any difficulty." If it isn't because of a health problem, or if the answer to the first question is "don't take medications," then R3MEDSA is set to .X. From Wave 4 forward, the coding is done in the same way as in Wave 3, except if the Respondent says "don't do" to the first question. In this case, another question asks if they think they would have difficulty if they did take medications. If the answer to this question is "yes," and it is because of a health problem, then RwMEDSA is set to "1" for "any difficulty." If the answer to this question is "no," then RwMEDSA is set to 0, for "no difficulty." Otherwise RwMEDSA is set to .X.

For other IADLs from Wave 3 forward, if a Respondent answers "no" or "yes" to a question asking if they have any difficulty, Rw[iadl]A is set to "0" for "no difficulty" or "1" for "any difficulty," respectively. If the answer is "can't do" then Rw[iadl]A is automatically set to "1" for "any difficulty." If the Respondent answers "don't do" and it is because of a health problem, Rw[iadl]A is set to "1" for "any difficulty." Otherwise, Rw[iadl]A is set to .X. For all waves when the help question is asked, if a Respondent answers "yes" to whether they get help and are missing Rw[iadl]A (equal to .X, .D or .R), then we set Rw[iadl]A to "yes."

The spouse variables are taken from the spouse's self-reported Wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

Some of the Rw[iadl]A variables are used to construct an IADL summary index. Please see "IADL Summary."

Another version of these variables simply recodes the raw HRS variables. Please see "Instrumental Activities of Daily Living (IADLs): Raw recodes" for a description of this version.

A third version of these variables is derived for Wave 1 only (R1[iadl]W). They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper. These are provided for comparison to the results found in that paper. Please see "IADLs: Recodes for comparison to Wallace and Herzog" for a description of the R1MAPW, R1CALCW, R1MCVW, and R1COMPW variables. Note that the Wallace and Herzog variables result in more limitation than the 0/1 recodes done in other waves

(Rw[iadl]A) solely due to measurement differences in the raw data. The R1[iadl]W variables are not appropriate for comparison to the Rw[iadl]A variables in other waves.

## Cross Wave Differences in Original HRS Data

Each wave has a series of questions about limits on instrumental activities of daily living (IADLs), but the specific activities, the question wording, and possible answers vary across waves. Some measures described here are not normally used as IADLs, but are included with them because they seemed to serve a similar measurement function in Wave 1. The IADL measures described here are: using the phone (RwPHONE), taking medications (RwMEDS), managing money (RwMONEY), shopping for groceries (RwSHOP), preparing meals (RwMEALS), using a map (RwMAP), using a calculator (RwCALC), using a microwave (R1MCWV), and using a computer (R1COMP).

Respondents are asked about different IADL activities in Waves 1 and 2 than in the rest of the waves. Wave 1 asks about using a map, a calculator, a microwave, and a computer, but not about preparing meals, shopping for groceries, using the phone, taking medications, or managing money, which are activities normally considered IADLs. From Wave 2 forward, the questions about using a microwave or a computer are dropped, but using the phone, taking medications, and managing money are added. In Wave 2A and from Wave 3 forward, the questions about using a calculator are not asked, but shopping for groceries and preparing meals are added. Using a map is asked in all waves except Wave 2A. From Wave 3 forward, the set of IADLs is consistent and includes using the phone, taking medications, managing money, shopping for groceries, preparing meals, and using a map.

The question wording and answers also varied across waves. The Wave 1 questions ask:

"Here are some other activities that people may have difficulty with. How difficult is it for you to [...]?"

The Respondent can answer "not at all difficult," "a little difficult," "somewhat difficult," "very difficult/can't do," or "don't do." The answers translate into 4 codes from "1" for "not at all difficult" to "4" for "very difficult/can't do." Another code is used for the "Don't do" response. The specific wording for the IADLs is: use a map to figure out how to get around a strange place, use a microwave oven after reading the instructions, use a calculator to help balance your checkbook, and use a computer or word processor.

In Wave 2H the question wording is similar to that in Wave 1, but is asked in 2 parts:

1) "Here are some other activities that people may have difficulty with. Do you have any difficulty with ...?" Respondent can answer yes or no.

2) [IF YES] "Is that a little difficulty or a lot of difficulty?"

In the data the answers to the two-part question are recoded into 5-categories: 1=yes, a little difficult; 2=yes, a lot; 3=yes, DK; 4=yes, RF; 5=No; 6=doesn't do. Note that there is no "Can't do" category and that "don't do" is not an option in the instrument. The "Doesn't do" category is likely the result of post-interview interpretation of interview comments, so are observed less frequently than in other waves, simply because of questionnaire differences. This difference is considerable among the IADLs. The specific wording for the IADLs is: using a map to figure out how to get around a strange place, using a calculator to help balance your checkbook, managing your money, making telephone calls, and following instructions for taking prescription medications.

In Wave 2A, the questions are asked differently for managing money and for other IADLs. The section is prefaced with the following:

"Here are a few other daily activities which some people have difficulty with. Please tell me whether you are able to do each activity without help from anyone else. If you don't do the activity at all, just tell me so."

Except for managing money, the IADL questions ask:

"Are you able to .. without help?" [IF DON'T DO] "Is that because of a health problem?"

If the Respondent reports being able to do any one of these activities without help, a question asks:

"Without help do you have any difficulty with [list of all applicable IADLs]?" [IF YES] "Is that a little or a lot of difficulty?"

The specific wording for these activities is: prepare(ing) hot meals, shop(ping) for groceries, make(ing) telephone calls and take(ing) medications.

For managing money the Wave 2A questions ask:

- 1) "Do you manage your money-such as paying your bills and keeping track of expenses, without anyone's help?"
- 2) [IF NO] "Is that because of a health or memory condition?"
- 3) [IF YES, DK, or RF to Q1, or YES to Q2] "Do you have any difficulty managing your money (when someone is helping you/without help)?"
- 4) [IF YES to Q3] "Is that a little or a lot of difficulty?"

From Wave 3 forward, the question wording is again similar to that in Wave 1, but prefaced with additional text. The question asks:

"Here are a few other activities which some people have difficulty with because of a physical, mental, emotional, or memory problem. Please tell me if you have any difficulty with each activity I name. If you don't do the activity at all, just tell me so. Exclude any difficulties you expect to last less than three months."

For using a map, the question in Wave 3 is: "Do you have any difficulty using a map to figure out how to get around in a strange place?" From Wave 4 forward, this is prefaced with "Because of a health or memory problem...." Responses may be "yes," "no," "can't do," or "don't do."

For other IADLs, a series of questions may be asked:

- 1) "Because of a health or memory problem do you have any difficulty with ...?" The Respondent can answer "yes," "no," "can't do," or "don't do." In Wave 3, for taking medications, the wording for "don't do" is "don't take medications."
- 2) From Wave 4 forward for taking medications [If DON'T DO to Q1] "Do you think you would have any difficulty taking medications if you needed to do so?"
- 3) [If YES, DK, or RF to Q2 for taking medications from Wave 4 forward; CAN'T DO to Q1 for taking medications in Wave 3; or CAN'T DO or DON'T DO to Q1 for all other activities] "Is that because of a health or memory problem?" The Respondent can answer "yes" or "no." In Wave 3A, this question is also asked if the response to Q1 is don't know or refuse. In Wave 3A and 3H, this question is skipped for a "don't take medications" response. From Wave 4 forward, whether the question is asked depends on the answer to Q2 for taking medications, if Q1 had a "don't do" response.
- 4) [If YES, DK, or RF to Q1 or Q3] "Does anyone help you ...?" The Respondent can answer "yes" or "no." In Wave 3, this question is not asked for managing money when the Q1 response is "Don't Know" or "Refuse." From Wave 4 forward, this question is not asked if the Respondent is living in a nursing home. In Wave 7, a mistake in the Spanish instrument allowed "can't do" and "don't do" responses for the help questions, and a few of these responses are given for all of the IADLs, except help with medications and money.

The specific wording for these activities is: prepare(ing) a hot meal, shop(ping) for groceries, make(ing) phone calls, take(ing) medications, and manage(ing) your money – such as paying your bills and keeping track of expenses.

## How Constructed

These IADL variables are derived for Wave 1 only. They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper (Wallace and Herzog, 1995). These variables are provided for comparison to the results found in that paper.

Wallace and Herzog recode the IADL variables to 1 for "any difficulty" if the Respondent answered "a little difficult," "somewhat difficult," or "very difficult/can't do." A response of "not difficult at all" is recoded to zero. This recoding scheme is applied for these variables to attempt to replicate the results reported in their paper.

The spouse variables are taken from the spouse's self-reported Wave 1 data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

There are several other versions of these variables. One version simply recodes the raw HRS variables. Please see the descriptions of

these (RwMAP, RwCALC, R1MCWV, R1COMP) under "Instrumental Activities of Daily Living (IADLs): Raw recodes."

Another version recodes a yes/no dummy variable in waves other than Wave 1, but these are not comparable with the Wallace and Herzog recodes. Please see the descriptions of these under "Instrumental Activities of Daily Living (IADLs): Any difficulty."

Some of the Wallace and Herzog indices are also derived, and include some of these measures in creating functional limitation indices, including an IADL summary index for Wave 1. Please see "IADL Summary."

## Cross Wave Differences in Original HRS Data

Each wave has a series of questions about limits on instrumental activities of daily living (IADLs), but the specific activities, the question wording, and possible answers vary across waves.

Wave 1 asks about using a map, a calculator, a microwave, and a computer, but not about preparing meals, shopping for groceries, using the phone, taking medications, or managing money. From Wave 2 forward, the questions about using a microwave or a computer are dropped, but using the phone, taking medications, and managing money are added. From Wave 2A and Wave 3 forward, the questions about using a calculator are no longer asked, but shopping for groceries and preparing meals are added. Please note that only using a map is consistently asked in all waves, except Wave 2A.

The question wording and answers also varied across waves. The Wave 1 questions ask:

"Here are some other activities that people may have difficulty with. How difficult is it for you to [...]?"

The Respondent can answer: not at all difficult, a little difficult, somewhat difficult, very difficult/can't do, or don't do. The answers translate into 4 codes from "1" for "not at all difficult" to "4" for "very difficult/can't do." Another code is used for the "Don't do" response.

The wording for the map activity is "use a map to figure out how to get around a strange place." The wording for the calculator activity is "use a calculator to help balance your checkbook." The wording for the microwave activity is "use a microwave oven after reading the instructions." The wording for the computer activity is "use a computer or word processor."

In subsequent waves, there is a question that simply asks if the Respondent has any difficulty with a particular activity. The question wording and possible answers are sufficiently different that the levels of Wave 1 codes cannot be derived from the data.

## Categorical Variable Codes

---

R1WALKS: R Diff-Walk sev blocks

---

Value		w1
1.Not at all diff		9441
2.A little diff		1320
3.Somewhat diff		886
4.Very diff/can't do		824
7.Don't do		181

---

R2WALKS: R Diff-Walk sev blocks

---

Value		w2
.D=DK		340
.M=Oth missing		1
.R=RF		1
0.No		14211
1.Yes,a little		1600
2.Yes,a lot		2079
3.Yes,DK/NA how much		498
4.Yes,RF how much		2
5.Can't do		371
7.Don't do		539

---

RwWALKS: R Diff-Walk sev blocks

---

Value		w3	w4	w5	w6	w7	w8	w9	w10

## How Constructed

These variables recode raw variables for difficulty with activities besides activities of daily living (ADLs) and instrumental activities of daily living (IADLs) as they appear in the raw data, except for missing values, and accounting for skip patterns. The activities described here include walking several blocks (RwWALKS), jogging one mile (RwJOG), walking one block (RwWALK1), sitting for about 2 hours (RwSIT), getting up from a chair after sitting for long periods (RwCHAIR), climbing several flights of stairs without resting (RwCLIMS), climbing one flight of stairs without resting (RwCLIM1), lifting or carrying weights over 10 pounds (RwLIFT), stooping kneeling, or crouching (RwSTOOP), reaching arms above shoulder level (RwARMS), pushing or pulling large objects (RwPUSH), and picking up a dime from the table (RwDIME). These variables are referred to as Rw[func] in the descriptions below.

Note that RwJOG, RwWALK1, RwCLIMS, RwSIT, RwCHAIR, RwSTOOP, and RwARMS are not asked in Wave 2A. These variables are set to .Q in Wave 2 for AHEAD Respondents.

The recodes vary across waves because the question and responses can vary across waves. In Wave 1, the HRS imputations are left in place. In all other waves "don't know" is recoded to special missing code .D and "refused" is recoded to .R. In Wave 1 "difficulty with an activity" is rated on a 4-point scale from "no difficulty" to "very difficult/can't do." These are assigned without change. A "don't do" answer is recoded to "7."

In Wave 2, the question asks if the Respondent has any difficulty with an activity and if so, asks follow-up questions about the degree of difficulty. In Wave 2H, the raw variable codes both questions as one categorical variable. In Wave 2A the answer to the first question and a categorical variable for the follow-up are given. In either case, a "no" answer to the first question about any difficulty is recoded to "0," and the categorical levels of difficulty are recoded appropriately to "a little" and "a lot," or "don't know/refused how much." In Wave 2A, "can't do" is recoded to "5." In Wave 2H, the "can't do" is not allowed. A "don't do" response is coded as "7."

From Wave 3 forward, the answers are simply "yes" for difficulty and "no" if not, which are coded "1" and "0," respectively. A "can't do" response is recoded to "2" and a "don't do" response is recoded to "7."

In some waves, questions about activities are skipped based on answers to previous questions. In Waves 1 and 2H, if a Respondent reports no difficulty jogging a mile, then the questions about walking several blocks and walking one block are skipped. In these cases, RwWALKS and RwWALK1 are set to "0" for "no difficulty." In Wave 2A if the Respondent reports needing help in getting across a room, then the questions about walking several blocks, climbing one flight of stairs, and pushing large objects are skipped. In these cases difficulty is assumed for the skipped activities, and R2WALKS, R2CLIM1, and R2PUSH are set to "3, difficulty," but how much is not ascertained.

From Wave 3 forward, if the Respondent reports no difficulty walking several blocks, the question about walking one block is skipped, and RwWALK1 is set to "0" for "no difficulty." If the Respondent reports difficulty walking several blocks, the question about jogging one mile is skipped and RwJOG is set to "1" for "difficulty." If the Respondent reports "can't do" or "don't do" for walking several blocks, the question about jogging one mile is also skipped and RwJOG is set to can't do or don't do, respectively. If the Respondent reports "don't do" for walking several blocks and "can't do" for walking 1 block, then RwJOG is set to "can't do" since that is more indicative of their level.

In all waves except 2A, if the Respondent said no difficulty to climbing several flights of stairs, the question about climbing one flight of stairs is skipped, and RwCLIM1 is set to "0" for no difficulty.

The spouse variables are taken from the spouse's self-reported Wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

There are other versions of the Rw[func] variables that recode to a yes/no measure for use in creating indices. One version of this variable is derived that attempts to code a consistent cross-wave yes/no dummy that indicates "any difficulty" (Rw[func]A). These are available from Wave 2 forward. Because of the inconsistent coding of the underlying HRS data, we do not construct R1[func]A variables in Wave 1. Please see the description of the Rw[func]A variables under "Other functional limitations: Any difficulty" for this version. Some of the Rw[func]A variables are used to construct functional limitation indices. Please see "Other Summary Indices."

A third version of these variables are derived for Wave 1 only (R1[func]W). They code a yes/no dummy that indicates "any

difficulty" in a manner used by Wallace and Herzog in their paper. These are provided for comparison to the results found in that paper. Please see "Other functional limitations: Recodes for comparison to Wallace and Herzog" for a description of the R1[func]W variables. Note that the Wallace and Herzog variables result in more limitation than the 0/1 recodes done in other waves (Rw[func]A) solely due to measurement differences in the raw data. The R1[func]W variables are not appropriate for comparison to the Rw[func]A variables in other waves.

## Cross Wave Differences in Original HRS Data

In all waves questions ask about a number of activities, such as climbing stairs or picking up a dime, but the question wording and possible answers vary. In Waves 1 and 2H, questions about activities of daily living (ADLs) are embedded among those about other functional limitations. This description applies to the other functional limitations. The Wave 1 questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. Please look at the answer categories at the top of page one of the booklet and tell me how difficult each activity is for you. Exclude any difficulties that you expect to last less than three months. How difficult is it for you to [...] Is it not at all difficult, a little difficult, somewhat difficult, very difficult, or something that you can't do at all?"

The Respondent can also answer "don't do." The answers translate into 4 codes: 1 for "not at all difficult," 2 for "a little difficult," 3 for "somewhat difficult," and 4 for "very difficult/can't do." Another code is used for the "Don't do" response. The first question asks how difficult it is to run or jog a mile. The specific wording for the other functional limitations (besides ADLs) is: walk several blocks; walk one block; sit for about 2 hours; get up from a chair after sitting for long periods; climb several flights of stairs without resting; climb one flight of stairs without resting; lift or carry weights over 10 pounds like a heavy bag of groceries; stoop, kneel, or crouch; pick up a dime from the table; reach or extend your arms above shoulder level; and push or pull large objects like a living room chair. If the Respondent says they have "no difficulty" with running a mile, then all the questions about walking, including several blocks, one block, and across a room, are skipped. If "no difficulty" is reported for walking several blocks then the questions about walking one block or across a room are skipped, and if "no difficulty" is reported for walking one block, the question about walking across a room is skipped. Likewise if "no difficulty" climbing several flights of stairs is reported, the question about climbing one flight of stairs is skipped.

In Wave 2H the questions and answers differ. The questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. Please tell me how difficult each of the following activities is for you. Exclude any difficulties that you expect to last less than three months. Do you have any difficulty with ...?" [IF YES] "Is that a little difficulty or a lot of difficulty?"

In the data the answers to the two-part question are recoded into 5-categories: 1=yes, a little difficult; 2=yes, a lot; 3=yes, DK; 4=yes, RF; 5=No; 6=doesn't do. Note that there is no "Can't do" category and that "Don't do" is not an option in the instrument. The "Doesn't do" category is likely the result of post-interview interpretation of interview comments, so may be observed less frequently than in other waves, simply because of questionnaire differences. The number of "Don't do" responses is much larger in other waves for most activities. The specific wording for these activities and the question skips for walking and climbing stairs are the same as in Wave 1.

In Wave 2A, the questions are different from other waves and the list of activities is shorter. Also the ADL questions are asked first as a group. The questions ask about functional difficulties besides ADLs and IADLs:

"Do you have any difficulty ...?" Answers may be "yes," "no," "can't do" and "don't do." [If YES]: "Is that a little, or a lot of difficulty?" [If DON'T DO to the first question]: "Is that because of a health problem?"

The specific wording for these activities is: walking several blocks; climbing one flight of stairs without resting; pushing or pulling large objects like a living room chair; lifting or carrying weights over 10 pounds like a heavy bag of groceries; and picking up a dime from the table. If the Respondent reports needing help getting across a room earlier in the interview, then the questions about walking several blocks, climbing stairs, and pushing large objects are skipped.

From Wave 3 forward, the questions about ADLs and IADLs are asked after those about the other activities described here. The questions ask:

"We need to understand difficulties people may have with various activities because of a health or physical problem. Please tell me whether you have any difficulty doing each of the everyday activities that I read to you. Exclude any difficulties that you expect to last less than three months. Because of a health problem do you have any difficulty with ...?"

The answers to the difficulty questions are simply yes, no, can't do, or don't do. The exact wording for these activities is: walking several blocks; running or jogging about a mile; across a room; walking one block; sitting for about 2 hours; getting up from a chair after sitting for long periods; climbing several flights of stairs without resting; climbing one flight of stairs without resting; stooping, kneeling, or crouching; reaching or extending your arms above shoulder level; pushing or pulling large objects like a living room chair; lifting or carrying weights over 10 pounds like a heavy bag of groceries; and picking up a dime from the table. If the Respondent reports no difficulty to walking several blocks, then the question about running a mile is asked, and the question about walking one block is skipped. If the Respondent reports difficulty to walking several blocks, then the question about running a mile is skipped. The question about climbing one flight of stairs is skipped if no difficulty is reported for climbing several flights of stairs.

In Wave 7, the interviewer may also say the following if the Respondent is in a nursing home or confined to bed or a wheelchair, before asking about these activities:

"I am required to ask about all of these activities. I realize that you may not be able to do some of them, but I would appreciate it if you would just confirm that with me as we go through the list."

## How Constructed

These variables recode raw data about difficulty with activities other than activities of daily living (ADLs) and instrumental activities of daily living (IADLs) as yes/no dummy variables, where "1" means "any difficulty" and "0" means "no difficulty." These other activities include: walking several blocks (RwWALKSA), jogging one mile (RwJOGA), walking one block (RwWALK1A), sitting for about 2 hours (RwSITA), getting up from a chair after sitting for long periods (RwCHAIRA), climbing several flights of stairs without resting (RwCLIMSA), climbing one flight of stairs without resting (RwCLIM1A), lifting or carrying weights over 10 pounds (RwLIFTA), stooping kneeling, or crouching (RwSTOOPA), reaching arms above shoulder level (RwARMSA), pushing or pulling large objects (RwPUSHA), and picking up a dime from the table (RwDIMEA). In the following, references to Rw[func]A apply to all these variables. Note that questions used to derive RwJOGA, RwWALK1A, RwCLIMSA, RwSITA, RwCHAIRA, RwSTOOPA, and RwARMSA are not asked in Wave 2A. These variables are set to .Q in Wave 2 for AHEAD Respondents.

We attempt to make consistent variables across waves. Because of significant differences in question wording in Wave 1, we do not include these variables for this interview year. There are other cross wave differences in the way HRS presented these questions in Waves 2H and 2A and the later waves that may introduce measurement errors in these variables. In particular, there are far fewer "don't do" responses for many activities in Wave 2H than in other waves. In addition, the criteria used for skipping some questions was different in Wave 2A, which may influence the consistency of measurement for R2WALKSA, R2CLIM1A, and R2PUSHA.

The variable derivations for any difficulty (Rw[func]A) vary across waves because the question and responses can vary across waves. In Wave 2, if a Respondent answers "yes" to the first question ("Do you have any difficulty with ...") Rw[func]A is set to "1" for "any difficulty," regardless of how much difficulty the Respondent says they have in the follow-up question. From Wave 3 forward, if a Respondent answers "yes" or "can't do" to the any difficulty question, Rw[func]A is set to "1" for "any difficulty."

In all waves, if the Respondent answers "no" to the any difficulty question, Rw[func]A is set to zero. A "don't do" response is recoded to missing value .X, since the Respondent hasn't revealed whether they would have difficulty with the activity if they ever did it. If the response is "don't know" or "refuse," Rw[func]A is set to special missing codes .D or .R, respectively.

In Wave 2A, if the response to the difficulty question is "don't do," a follow-up question asks if this is because of health. If it is because of health, then R2[func]A is set to "1" for difficulty. Otherwise it is set to .X for "don't do."

In some waves, questions about activities are skipped based on answers to previous questions. In Wave 2H, if a Respondent said "no difficulty jogging a mile," then the questions about walking several blocks and walking one block are skipped. In these cases, R2WALKSA and R2WALK1A are set to "0" for "no difficulty." In Wave 2H and from Wave 3 forward, if "no difficulty" is reported for walking several blocks, the question about walking one block is skipped, and RwWALK1A is set to "0" for "no difficulty." Similarly if "no difficulty" is reported for climbing several flights of stairs, RwCLIM1A is set to "0" for "no difficulty climbing one flight of stairs." From Wave 3 forward, if the Respondent reports difficulty walking several blocks, the question about jogging one mile is skipped and RwJOG is set to "1" for "difficulty." In Wave 2A, if the Respondent reported needing help to get across a room, the questions about walking several blocks, climbing a flight of stairs, and pushing large objects are skipped. In these cases, difficulty with these tasks is assumed, so R2WALKSA, R2CLIM1A, and R2PUSHA are set to "1."

The spouse variables are taken from the spouse's self-reported Wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

Some of these variables are used to construct functional limitation indices. Please see "Other Summary Indices."

Another version of these variables simply recodes the raw HRS variables. Please see the description of the Rw[func] variables under "Other functional limitations: Raw recodes" for this version.

A third version of these variables are derived for Wave 1 only (R1[func]W). They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper. These are provided for comparison to the results found in that paper. Please see "Other functional limitations: Recodes for comparison to Wallace and Herzog" for a description of the R1[func]W variables. Note that the Wallace and Herzog variables result in more limitation than the 0/1 recodes described here for other waves (Rw[func]A) solely due to measurement differences in the raw data. The R1[func]W variables are not appropriate for comparison to the Rw[func]A variables in other waves.

## Cross Wave Differences in Original HRS Data

In all waves questions ask about a number of activities, such as climbing stairs or picking up a dime, but the question wording and possible answers vary. In Waves 1 and 2H, questions about activities of daily living (ADLs) are embedded among those about other functional limitations. This description applies to the other functional limitations. The Wave 1 questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. Please look at the answer categories at the top of page one of the booklet and tell me how difficult each activity is for you. Exclude any difficulties that you expect to last less than three months. How difficult is it for you to [...] ? Is it not at all difficult, a little difficult, somewhat difficult, very difficult, or something that you can't do at all?"

The Respondent can also answer "don't do." The answers translate into 4 codes: 1 for "not at all difficult," 2 for "a little difficult," 3 for "somewhat difficult," and 4 for "very difficult/can't do." Another code is used for the "Don't do" response. The first question asks how difficult it is to run or jog a mile. The specific wording for the other functional limitations (besides ADLs) is: walk several blocks; walk one block; sit for about 2 hours; get up from a chair after sitting for long periods; climb several flights of stairs without resting; climb one flight of stairs without resting; lift or carry weights over 10 pounds like a heavy bag of groceries; stoop, kneel, or crouch; pick up a dime from the table; reach or extend your arms above shoulder level; and push or pull large objects like a living room chair. If the Respondent says they have "no difficulty" with running a mile, then all the questions about walking, including several blocks, one block, and across a room, are skipped. If "no difficulty" is reported for walking several blocks, then the questions about walking one block or across a room are skipped, and if "no difficulty" is reported for walking one block, the question about walking across a room is skipped. Likewise if "no difficulty" climbing several flights of stairs is reported, the question about climbing one flight of stairs is skipped.

In Wave 2H the questions and answers differ. The questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. Please tell me how difficult each of the following activities is for you. Exclude any difficulties that you expect to last less than three months. Do you have any difficulty with ...?" [IF YES] "Is that a little difficulty or a lot of difficulty?"

In the data the answers to the two-part question are recoded into 5-categories: 1=yes, a little difficult; 2=yes, a lot; 3=yes, DK; 4=yes, RF; 5=No; 6=doesn't do. Note that there is no "Can't do" category and that "don't do" is not an option in the instrument. The "Doesn't do" category is likely the result of post-interview interpretation of interview comments so may be observed less frequently than in other waves, simply because of questionnaire differences. The number of "Don't do" responses is much larger in other waves for most activities. For example, only 16 and 91 say "don't do" for sitting for 2 hours and climbing several flights of stairs in Wave 2H, but 87 and 736 have this response in Wave 3H, respectively. The specific wording for these activities and the question skips for walking and climbing stairs are the same as in Wave 1.

In Wave 2A, the questions are different from other waves and the list of activities is shorter. Also the ADL questions are asked first as a group. The questions about functional difficulties besides ADLs and IADLs ask:

"Do you have any difficulty ...?" Answers may be "yes," "no," "can't do" and "don't do." [If YES]: "Is that a little, or a lot of difficulty?" [If DON'T DO to the first question]: "Is that because of a health problem?"

The specific wording for these activities is: walking several blocks; climbing one flight of stairs without resting; pushing or pulling large objects like a living room chair; lifting or carrying weights over 10 pounds like a heavy bag of groceries; and picking up a dime from the table. If the Respondent reports needing help getting across a room earlier in the interview, then the questions about walking several blocks, climbing stairs, and pushing large objects are skipped.

From Wave 3 forward, the questions about ADLs and IADLs are asked after those about the other activities described here. The questions ask:

"We need to understand difficulties people may have with various activities because of a health or physical problem. Please tell me whether you have any difficulty doing each of the everyday activities that I read to you. Exclude any difficulties that you expect to last less than three months. Because of a health problem do you have any difficulty with ...?"

The answers to the difficulty questions are simply "yes," "no," "can't do," or "don't do." The exact wording for these activities is: walking several blocks; running or jogging about a mile; across a room; walking one block; sitting for about 2 hours; getting up from a chair after sitting for long periods; climbing several flights of stairs without resting; climbing one flight of stairs without resting; stooping, kneeling, or crouching; reaching or extending your arms above shoulder level; pushing or pulling large objects like a living room chair; lifting or carrying weights over 10 pounds like a heavy bag of groceries; and picking up a dime from the table. If the Respondent reports no difficulty to walking several blocks, then the question about running a mile is asked, and the question about walking one block is skipped. If the Respondent reports difficulty to walking several blocks, then the question about running a mile is skipped. The question about climbing one flight of stairs is skipped if no difficulty is reported for climbing several flights of stairs.

From Wave 7 forward, the interviewer may also say the following if the Respondent is in a nursing home or confined to bed or a wheelchair, before asking about these activities:

"I am required to ask about all of these activities. I realize that you may not be able to do some of them, but I would appreciate it if you would just confirm that with me as we go through the list."

## How Constructed

These functional limitation variables are derived for Wave 1 only. They code a yes/no dummy that indicates "any difficulty" in a manner used by Wallace and Herzog in their paper (Wallace and Herzog, 1995). These variables are provided for comparison to the results found in that paper.

Wallace and Herzog recode the functional limitation variables to "1" for "any difficulty" if the Respondent answered "a little difficult," "somewhat difficult" or "very difficult/can't do." A response of "not difficult at all" is recoded to zero. This recoding scheme is applied for these variables to attempt to replicate the results reported in their paper.

If a Respondent reports "no difficulty" jogging a mile, then the questions about walking several blocks and walking one block are skipped. In these cases R1WALKSW and R1WALK1W are set to "0" for "no difficulty." Similarly if the Respondent reports "no difficulty" walking several blocks or climbing several flights of stairs, then the questions about walking one block or climbing one flight of stairs, respectively, are skipped. In these cases R1WALK1W and R1CLIM1W are set to "0" for "no difficulty" as appropriate.

The spouse variables are taken from the spouse's self-reported Wave 1 data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

There are several other versions of these variables. One version simply recodes the raw HRS variables. Please see the descriptions of these under "Other Functional Limitations: Raw recodes."

Another version recodes a yes/no dummy variable in waves other than Wave 1, but these are not comparable with the Wallace and Herzog recodes. Please see the descriptions of these under "Other Functional Limitations: Any difficulty."

Some of the Wallace and Herzog indices are also derived and include some of these measures in creating functional limitation indices. Please see "Other Summary Indices."

## Cross Wave Differences in Original HRS Data

In all waves questions ask about a number of activities, such as climbing stairs or picking up a dime, but the question wording and possible answers vary. In Waves 1 and 2H, questions about activities of daily living (ADLs) are embedded among those about other functional limitations. This description applies to the other functional limitations. The Wave 1 questions ask:

"We are interested in how much difficulty people have with various activities because of a health or physical problem. Please look at the answer categories at the top of page one of the booklet and tell me how difficult each activity is for you. Exclude any difficulties that you expect to last less than three months. How difficult is it for you to [...]? Is it not at all difficult, a little difficult, somewhat difficult, very difficult, or something that you can't do at all?"

The Respondent can also answer "Don't do." The answers translate into 4 codes: 1 for "not at all difficult," 2 for "a little difficult," 3 for "somewhat difficult," and 4 for "very difficult/can't do." Another code is used for the "Don't do" response. The first question asks how difficult it is to run or jog a mile. The specific wording for the other functional limitations (besides ADLs) is: walk several blocks; walk one block; sit for about 2 hours; get up from a chair after sitting for long periods; climb several flights of stairs without resting; climb one flight of stairs without resting; lift or carry weights over 10 pounds like a heavy bag of groceries; stoop, kneel, or crouch; pick up a dime from the table; reach or extend your arms above shoulder level; and push or pull large objects like a living room chair. If the Respondent says they have no difficulty with running a mile, then all the questions about walking, including several blocks, one block, and across a room, are skipped. If "no difficulty" is reported for walking several blocks, then the questions about walking one block or across a room are skipped, and if "no difficulty" is reported for walking one block, the question about walking across a room is skipped. Likewise if "no difficulty" climbing several flights of stairs is reported, the question about climbing one flight of stairs is skipped.

Note that these variables are only derived for Wave 1. In subsequent waves, the question wording and possible answers are sufficiently different that the levels of Wave 1 codes cannot be derived from the data.

## HRS Variables Used

HRS 1992:	
V304	B4A:RUN OR JOG 1 MIL:IMP
V305	B4B:WALK SEVERAL BLO:IMP
V306	B4C:WALK 1 BLOCK :IMP

## How Constructed

### Core Interview Variables

RwADL5A and RwADL6A provide Activities of Daily Living (ADL) summaries, derived from Wave 2 forward, and measures the number of ADLs where "any difficulty" was reported. RwADL5A includes difficulty bathing, dressing, eating, getting in/out of bed, and walking across a room. RwADL6A adds difficulty toileting. The "any difficulty" versions of the individual measures are used to construct these measures, i.e., RwWALKRA, RwBEDA, RwBATHA, RwDRESSA, RwEATA, and RwTOILTA. Each limitation adds one to the summary measure, that is:

$$\text{RwADL5A} = \text{sum} (\text{RwBATHA}, \text{RwDRESSA}, \text{RwEATA}, \text{RwBEDA}, \text{RwWALKRA})$$

$$\text{RwADL6A} = \text{sum} (\text{RwBATHA}, \text{RwDRESSA}, \text{RwEATA}, \text{RwBEDA}, \text{RwWALKRA}, \text{RwTOILTA})$$

Please see "Activities of Daily Living (ADLs): Any difficulty" for a description of how the individual 0/1 variables (Rw[adl]A) are constructed. Note that special missing values in the input variables (including "don't do" which is coded as .X) are counted as a zero input to the summary variables unless all inputs are missing, in which case the summary variable is set to missing as well.

Note that RwADL5A does not include RwTOILTA, which is not available for Wave 2H Respondents. RwADL6A includes RwTOILTA but for Wave 2H Respondents R2ADL6A is set to .Q to indicate that this measure is not available.

Because of significant differences in question wording in Wave 1, we do not include these variables for this interview year. There are other cross wave differences in the way HRS presented these questions in Waves 2H and 2A and the later waves that may introduce measurement errors in these variables. In addition, the criteria used for skipping some questions changed between Wave 3 and later waves, which may also influence the consistency of measurement before Wave 4 for all ADLs except dressing.

For Wave 1, an alternate version of the measure (R1ADLW) is derived. R1ADLW uses the variables recoded for comparison to Wallace and Herzog and is provided for comparison to the results found in that paper. Each limitation adds one to the summary measure, that is:

$$\text{R1ADLW} = \text{sum} (\text{R1BATHW}, \text{R1DRESSW}, \text{R1EATW}, \text{R1BEDW}, \text{R1WALKRW})$$

Please see "Activities of Daily Living (ADLs): Recodes for Comparison to Wallace and Herzog" for a description of how these 0/1 variables (Rw[adl]W) are constructed. Note that the Wallace and Herzog variables result in more limitation than the 0/1 recodes for other waves (Rw[adl]A) solely due to measurement differences in the raw data. The R1ADLW variables is not appropriate for comparison to the RwADLA variables in other waves.

RwADL5H and RwADL6H provide Activities of Daily Living (ADL) summaries, derived from Wave 2 forward, and measure the number of ADLs where Respondents report getting help. RwADL5H includes getting help bathing, dressing, eating, getting in/out of bed, and walking across a room. RwADL6H adds getting help toileting. Each ADL where getting help was reported adds one to the summary measure, that is:

$$\text{RwADL5H} = \text{sum} (\text{RwBATHH}, \text{RwDRESSH}, \text{RwEATH}, \text{RwBEDH}, \text{RwWALKRH})$$

$$\text{RwADL6H} = \text{sum} (\text{RwBATHH}, \text{RwDRESSH}, \text{RwEATH}, \text{RwBEDH}, \text{RwWALKRH}, \text{RwTOILTH})$$

Please see "Activities of daily living (ADLs): Raw recodes" for a description of how the individual gets help variables (Rw[adl]H) are

constructed.

Note that RwADL5H does not include RwTOILTH, which is not available for Wave 2H Respondents. RwADL6H includes RwTOILTH but for Wave 2H Respondents R2ADL6H is set to .Q to indicate that this measure is not available.

The spouse variables are taken from the spouse's self-reported wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

See also IADL Summary and Other Summary Indices.

### **Exit Interview Variables**

READL5H and READL6H provide Activities of Daily Living (ADL) summaries and measure the number of ADLs where the Respondent received help in the last three months of life. READL5H includes getting help bathing, dressing, eating, getting in/out of bed, and walking across a room. READL6H adds getting help toileting. Each ADL where getting help was reported adds one to the summary measure, that is:

READL5H = sum (REBATHH, REDRESSH, REEATH, REBEDH, REWALKRH)

READL6H = sum (REBATHH, REDRESSH, REEATH, REBEDH, REWALKRH, RETOILTH)

The questions about receiving help are not asked in Wave 2H. READL5H and READL6H are set to .Q if the Respondent's Exit Interview took place in Wave 2H.

If the Respondent was bedridden around their time of death, the ADL help questions are skipped and READL5H and READL6H are set to .S. Bedridden is defined as spending more than half the day in bed for 86 or more days during the last three months before death. Please see "How Constructed" for REBEDRID for more information on bedridden status.

Please see "Activities of daily living (ADLs): Raw recodes" for a description of how the individual gets help variables (RE[adl]H) are constructed.

### **Core and Exit Differences**

The "has difficulty" questions are only asked in the Core Interviews and therefore the summary variables for the "has difficulty" questions (RwADL5A, RwADL6A) only exist for the Core Interviews.

In Wave 2H, the "gets help" questions are asked for all ADLs except Toileting in the Core Interviews. In the Exit Interviews, the "gets help" questions are not asked until Wave 3.

### **Cross Wave Differences in Original HRS Data**

#### **Core Interview Variables**

Please see "Cross Wave Differences in Original HRS Data" for the "Activities of daily living (ADLs): Any difficulty" section and the "Activities of daily living (ADLs): Raw recodes" section.

#### **Exit Interview Variables**

Please see "Cross Wave Differences in Original HRS Data" for the "Activities of daily living (ADLs): Raw recodes" section.

## How Constructed

### Core Interview Variables

RwIADL5A provides a summary measure for Instrumental Activities of Daily Living (IADL), available in Wave 2A and from Wave 3 forward, and measures the number of IADLs where "any difficulty" was reported. RwIADL5H includes difficulty using the phone, managing money, taking medications, shopping for groceries, and preparing hot meals. The "any difficulty" versions of the individual measures are used to construct these measures, i.e., RwPHONEA, RWMONEYA, RWMEDSA, RWSHOPA, and RWMEEALA. Each limitation adds one to the summary measure, that is:

$$\text{RwIADL5A} = \text{sum} (\text{RwPHONEA}, \text{RWMONEYA}, \text{RWMEDSA}, \text{RWSHOPA}, \text{RwMEALSA})$$

R2IADL5A is available only for AHEAD Respondents in Wave 2 (Wave 2A). For HRS Respondents, R2IADL5A is set to .Q to indicate that this measure is not available.

Please see "Instrumental Activities of Daily Living (IADLs): Any difficulty" for a description of how the individual 0/1 variables are constructed. Note that special missing values in the input variables (including "don't do" which is coded as .X) are counted as a zero input to the summary variables unless all inputs are missing, in which case the summary variable is set to missing as well.

The usual IADLs were not asked until Wave 2. Please see "Instrumental Activities of Daily Living (IADLs): Recodes for Comparison to Wallace and Herzog" for a description of how the individual Wave 1 IADL variables are derived.

RwIADL5H provides a summary measure for Instrumental Activities of Daily Living (IADL), derived from Wave 3 forward, and measures the number of IADLs where Respondents report getting help. RwIADL5H include difficulty using the phone, managing money, taking medications, shopping for groceries, and preparing hot meals. Each IADL where getting help was reported adds one to the summary measure, that is:

$$\text{RwIADL5H} = \text{sum} (\text{RwPHONEH}, \text{RWMONEYH}, \text{RwMEDSH}, \text{RwSHOPH}, \text{RwMEALSH})$$

Please see "Instrumental activities of daily living (ADLs): Raw recodes" for a description of how the individual gets help variables (Rw[iadl]H) are constructed.

The spouse variables are taken from the spouse's self-reported wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

See also ADL Summary and Other Summary Indices.

### Exit Interview Variables

REIADL5H provides a summary measure for Instrumental Activities of Daily Living (IADL) and measures the number of IADLs where the Respondent received help in the last three months of life. REIADL5H includes difficulty using the phone, managing money, taking medications, shopping for groceries, and preparing hot meals. Each IADL where getting help was reported adds one to the summary measure, that is:

$$\text{REIADL5H} = \text{sum} (\text{REPHONEH}, \text{REMONEYH}, \text{REMEDSH}, \text{RESHOPH}, \text{REMEALSH})$$

The questions about receiving help are not asked in Wave 2H. REIADL5H is set to .Q if the Respondent's Exit Interview took

place in Wave 2H.

If the Respondent was living in a nursing home at the time of their death the IADL help questions are skipped and REIALD5H is set to .S. From Waves 3 to 5, if the Respondent was bedridden around their time of death, the IADL help questions are skipped and REIALD5H is set to .S. Bedridden is defined as spending 86 or more days in bed for more than half the day during the last three months before death. Please see "How Constructed" for REBEDRID for more information on bedridden status.

Please see "Instrumental activities of daily living (ADLs): Raw recodes" for a description of how the individual gets help variables (RE[iadl]H) are constructed.

### **Core and Exit Differences**

The "has difficulty" questions are only asked in the Core Interviews and therefore the summary variable for the "has difficulty" questions (RwIADL5A) only exist for the Core Interviews.

### **Cross Wave Differences in Original HRS Data**

#### **Core Interview Variables**

Please see "Cross Wave Differences in Original HRS Data" for the "Instrumental activities of daily living (IADLs): Any difficulty" section and the "Instrumental activities of daily living (ADLs): Raw recodes" section.

#### **Exit Interview Variables**

Please see "Cross Wave Differences in Original HRS Data" for the "Instrumental activities of daily living (ADLs): Raw recodes" section.
