## How Constructed

Several summary measures for functional limitations are included in an attempt to provide some consistency across waves. Wallace and Herzog present summary measures in their paper (Wallace and Herzog, 1995) which include measures for ADLs, mobility, large muscle, and IADLs. For ADL and IADL summary measures, please see "ADL Summary" and "IADL Summary." The mobility and large muscle indices are included here. After examining individual measures, two groupings of the most consistent cross wave measures were added, gross and fine motor summaries.

The large muscle index uses the sitting for 2 hrs, getting up from a chair, stooping, kneeling or crouching, and pushing or pulling large objects activities. The mobility index uses the walking one block, walking several blocks, walking across a room, climbing one flight of stairs, and climbing several flights of stairs activities. The fine motor index uses the picking up a dime, eating, and dressing activities. The gross motor index uses the walking one block, walking across a room, climbing one flight of stairs, getting in or out of bed, and bathing activities. In all waves the "any difficulty" versions of the individual measures are used to construct these measures. Each limitation adds one to the summary measure, that is:

RwMOBILA= sum (RwWALKSA, RwWALK1A, RwWALKRA, RwCLIMSA, RwCLIM1A)

RwLGMUSA= sum (RwSITA, RwCHAIRA, RwSTOOPA, RwPUSHA)

RwGROSSA= sum (RwWALK1A, RwWALKRA, RwCLIM1A, RwBEDA, RwBATHA)

RwFINEA= sum (RwDIMEA, RWEATA, RWDRESSA)

In Wave 2A, there is no R2WALK1A for R2GROSSA so we set .Q to R2GROSSA.

In Wave 2A, there are no R2WALK1A and R2CLIMSA so we set R2MOBILA and R2GROSSA to .Q for AHEAD Respondents in Wave 2. There are no R2SITA, R2CHAIRA and R2STOOPA so we set R2LGMUSA to .Q as well.

Please see "Activities of Daily Living (ADLs): Any difficulty" for a description of how RwWALKRA, RwBEDA, RwBATHA, RWEATA, and RWDRESSA are derived. Please see "Other Functional Limitations: Any difficulty" for a description of how the other individual 0/1 variables are constructed. Note that special missing values in the input variables (including "don't do" which is coded as .X) are counted as a zero input to the summary variables unless all inputs are missing, in which case the summary variable is set to missing as well.

For Wave 1 only, alternate versions of two of these measures are derived. R1MOBILW is analogous to RwMOBILA and R1LGMUSW is analogous to RwLGMUSA. These measures use the variables recoded for comparison to Wallace and Herzog, and are provided for comparison to the results found in that paper. Each limitation adds one to the summary measure, that is:

R1MOBILW= sum (R1WALKSW, R1WALK1W, R1WALKRW, R1CLIMSW, R1CLIM1W)

R1LGMUSW= sum (R1SITW, R1CHAIRW, R1STOOPW, R1PUSHW)

Please see "Activities of Daily Living (ADLs): Recodes for Comparison to Wallace and Herzog" for a description of how RwWALKRW

is derived. Please see "Other Functional Limitations: Recodes for Comparison to Wallace and Herzog" for how the other individual 0/1 variables are constructed.

The spouse variables are taken from the spouse's self-reported wave "w" data. If the Respondent is not married, spouse variables are set to .U=unmarried. If the Respondent's spouse did not respond, then the variables are set to .V=Spouse is non-response.

### **Cross Wave Differences in Original HRS Data**

In Wave 2A, there are no R2WALK1A and R2CLIMSA so we set R2MOBILA and R2GROSSA to .Q for AHEAD Respondents in Wave 2. There are no R2SITA, R2CHAIRA and R2STOOPA, so we set R2LGMUSA to .Q as well.

Please see "Cross Wave Differences in Original HRS Data" for the "Activities of daily living (ADLs): Any difficulty" and for "Other Functional Limitations: Any difficulty."

### Safety Supervision Prior to Death

Wave	Variable	Label	Type
E	RESUPER	RESUPER:EXIT R supervised for safety	Categ

### Descriptive Statistics

Variable	N	Mean	Std Dev	Minimum	Maximum
RESUPER	12617	0.70	0.46	0.0	1.0

### Categorical Variable Codes

RESUPER: EXIT R supervised for safety

Value	
.D=DK	139
.M=Oth missing	16
.Q=Not asked this wv	3727
.R=RF	12
.Y=No Exit Interview, No De	24500
.Z=No Exit Interview, Death	1394
0.No	3764
1.Yes	8853

### How Constructed

RESUPER indicates whether the Respondent received supervision to ensure safety in their last 3 months of life.

The question about safety supervision is first asked in Wave 6. RESUPER is set to .Q if the Respondent's Exit Interview took place from Waves 2A to 5.

### Cross Wave Differences in Original HRS Data

There are no questions asked about safety supervision prior to Exit Interview Wave 6; therefore RESUPER is set to .Q if the Respondent's Exit Interview took place from Wave 2A to 5.

### HRS Variables Used

#### Exit Interview Variables

HRS 2002-2020:

## How Constructed

RwHLPRTN is the Respondent's total number of helpers who helped last month. RwINHPTN is the total number of helpers who ever helped. These totals do not include employees of institutions as a result of the survey design as described below. RwINHPE indicates whether any employee of an institution ever helped. The number of employees of an institution cannot be accurately counted due to the nature of institutional care. SwHLPRTN, SwINHPTN, and SwINHPE provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

The SwHLPRTN, SwINHPTN, and SwINHPE variables are taken from the Wave "w" spouse's self-reported RwHLPRTN, RwINHPTN, and RwINHPE variables.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

In Wave 5, the spouse of the helper is automatically added to the helper list if the helper is listed as married in the household member and child preload file. Helpers listed as employees of an institution are not added to the helper list.

## How Constructed

RwHLPRPN is the Respondent's number of paid helpers who helped last month. RwinHPPN is the number of paid helpers who ever helped. RwHLPRUN is the Respondent's number of unpaid helpers who helped last month. RwinHPUN is the number of unpaid helpers who ever helped. These totals do not include employees of institutions as a result of the survey design as described below. SwHLPRPN, SwINHPPN, SwHLPRUN, and SwINHPUN provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

In the separate helper survey section, the Respondent is asked if each helper on the helper list was paid. The exceptions are

employees of institution, as described above, and spouse helpers, who are assumed to be unpaid.

The SwHLPRPN, SwINHPPN, SwHLPRUN, and SwINHPUN, variables are taken from the Wave "w" spouse's self-reported RwhLPRPN, RwhINHPPN, RwhLPRUN, and RwhINHPUN variables.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

## How Constructed

RwHLPRFN is the Respondent's number of family helpers who helped last month. RwINHPFN is the number of family helpers who ever helped. RwnHLPRNFN is the Respondent's number of non-family helpers who helped last month. RwnINHPNFN is the number of non-family helpers who ever helped. These totals do not include employees of institutions as a result of the survey design as described below. SwHLPRFN, SwINHPFN, SwHLPRNFN, and SwINHPNFN provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

In the separate helper survey section, the Respondent is asked if each helper on the helper list was paid. The exceptions are employees of institution, as described above, and spouse helpers, who are assumed to be unpaid.

The SwHLPRFN, SwINHPFN, SwHLPRNFN, and SwINHPNFN, variables are taken from the Wave "w" spouse's self-reported RwHLPRFN, RwINHPFN, RwHLPRNFN, and RwINHPNFN variables.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

## How Constructed

RwHLPDYST is the total number of days the Respondent got help last month. RwHLPHRST is the number of total hours the Respondent got help last month. SwHLPDYST and SwHLPHRST provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

The Respondent is asked how many days last month or days last week each helper on the helper list provided help. These answers are transformed into a monthly measure if necessary. Then the Respondent is asked how many hours per day a helper provided help. This value is multiplied by the number of days per month to derive the total number of hours per month variable. A Respondent can report hours or days helped from multiple helpers, which can result in the values of RwHLPDYST and RwHLPHRST being more than 31 and 744 respectively.

The SwHLPDYST and SwHLPHRST variables are taken from the Wave "w" spouse's self-reported RwHLPDYST and RwHLPHRST variables.

As with other helper variables, employees of institutions are excluded from the days and hours of help.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

## How Constructed

RwHLPDYSP is the number of days the Respondent got help last month from paid helpers. RwHLPDRSP is the number of total hours the Respondent got help last month from paid helpers. RwHLPDYSU is the number of days the Respondent got help last month from unpaid helpers. RwHLPDRSU is the number of hours the Respondent got help last month from unpaid helpers. SwHLPDYSP, SwHLPDRSP, SwHLPDYSU and SwHLPDRSU provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

In the separate helper survey section, the Respondent is asked if each helper on the helper list was paid. Employees of institutions are

excluded from the payment questions as are spouses, who are assumed to be unpaid. The Respondent is also asked how many days last month or days last week each helper on the helper list provided help. These answers are transformed into a monthly measure if necessary. Then the Respondent is asked how many hours per day a helper provided help. This value is multiplied by the number of days per month to derive the total number of hours per month variable. A Respondent can report hours or days helped from multiple helpers, which can result in the values of RwHLPDYSP and RwHLPDYSU being more than 31 days and RwHLPHRSP and RwRwHLPHRSU being more than 744 hours.

The SwHLPDYSP, SwHLPHRSP, SwHLPDYSU and SwHLPHRSU variables are taken from the Wave "w" spouse's self-reported RwHLPDYSP, RwHLPHRSP, RwHLPDYSU and RwHLPHRSU variables.

As with other helper variables, employees of institutions are excluded from the days and hours of help.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

## How Constructed

RwHLPDYSF is the number of days the Respondent got help last month from family helpers. RwHLPHRSF is the number of hours the Respondent got help last month from family helpers. RwHLPDYSNF is the number of days the Respondent got help last month from non-family helpers. RwHLPHRSNF is the number of hours the Respondent got help last month from non-family helpers. SwHLPDYSF, SwHLPHRSF, SwHLPDYSNF and SwHLPHRSNF provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

The Respondent is asked how many days last month or days last week each helper on the helper list provided help. These

answers are transformed into a monthly measure if necessary. Then the Respondent is asked how many hours per day a helper provided help. This value is multiplied by the number of days per month to derive the total number of hours per month variable. A Respondent can report hours or days helped from multiple helpers, which can result in the values of RwHLPDYSF and RwHLPDYSNF being more than 31 days and RwHLPHRSF and RwRwHLPHRSNF being more than 744 hours.

The SwHLPDYSF, SwHLPHRSF, SwHLPDYSNF and SwHLPHRSNF variables are taken from the Wave "w" spouse's self-reported RwHLPDYSF, RwHLPHRSF, RwHLPDYSNF and RwHLPHRSNF variables.

As with other helper variables, employees of institutions are excluded from the days and hours of help.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

### HRS Variables Used

## How Constructed

RwHLPPDTN is the total number of helpers the Respondent paid. The question does not specify a time period of payment, but it is only asked about helpers who helped last month. RwHLPPDTA is the total amount the Respondent paid to helpers last month. SwHLPPDTN and SwHLPPDTA provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

The Respondent is asked if each helper on the helper list was paid, and if so, how much they were paid excluding expenses paid by Medicaid or insurance. Payments could be reported for the last month, day, week or year. These amounts are transformed into a monthly measure if necessary. If a Respondent reported no helpers in the last month, RwHLPPDTN is set to .H=No helpers last month. Employees of institutions are excluded from the payment questions.

The SwHLPPDTN and SwHLPPDTA variables are taken from the Wave "w" spouse's self-reported RwHLPPDTN and RwHLPPDTA variables.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

## How Constructed

RwHLPPDFN is the number of family helpers the Respondent paid. RwHLPPDNFN is the number of non-family helpers the Respondent paid. The question does not specify a time period of payment, but it is only asked about helpers who helped last month. RwHLPPDFA is the amount the Respondent paid to family helpers last month. RwHLPPDNFA is the amount the Respondent paid to non-family helpers last month. SwHLPPDFN, SwHLPPDNFN, SwHLPPDFA, and SwHLPPDNFA provide this information for the Respondent's spouse or partner.

Respondents are asked whether they had any difficulty with several ADLs, IADLs and with managing their finances. If the Respondent indicated they had any difficulty with an ADL, the Respondent is asked if anyone ever helped them with that ADL. At the end of the ADL survey section, the Respondent is asked who helped with ADLs if any help was indicated. In the same manner, the Respondent is also asked who helped with IADLs and who helped with managing their finances. These three lists of helpers are compiled into a helper list and the Respondent is asked about the details of the help each helper provided individually in a separate survey section. A helper may be a spouse, child, child's spouse, grandchild, other relative, other individual, professional, member of an organization, or an employee of an institution. If a helper is an employee of an institution, they are added to the helper list, but the Respondent is not asked about this helper in the helper survey section.

The Respondent is asked if each helper on the helper list was paid, and if so, how much they were paid excluding expenses paid by Medicaid or insurance. Payments could be reported for the last month, day, week or year. These amounts are transformed into a monthly measure if necessary. If a Respondent reported no helpers in the last month, RwhLPPDFN and RwhLPPDNFN are set to .H=No helpers last month. Employees of institutions are excluded from the payment questions as are spouses, who are assumed to be unpaid.

The SwHLPPDFN, SwHLPPDFA, SwHLPPDNFN and SwHLPPDNFA variables are taken from the Wave "w" spouse's self-reported RwhLPPDFN, RwhLPPDFA, RwhLPPDNFN and RwhLPPDNFA variables.

## Cross Wave Differences in Original HRS Data

Helper variables are available in all waves except Wave 1 and Wave 2.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed net value of real estate is assigned to HwARLES. The HwAFRLES variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

In Wave 2A, ownership of a second home is asked about within the context of real estate investments. Therefore, H2ARLES is corrected by subtracting the net value of the second home. See the "Net value of secondary residence" section for more information.

## Cross Wave Differences in Original HRS Data

The net value of real estate, besides the primary residence, is asked in each wave. The question wording is similar in all waves, but the unfolding bracket questions vary. Two questions reveal whether the Respondent owns any real estate and if so, the value of it:

In Wave 2A, the questions ask:

- a) "Do you (or your (husband/wife/partner)) have any real estate (other than your main home), such as land, a second home, rental real estate, a partnership, or money owed to you on a land contract or mortgage?"
- b) "If you sold all that and then paid off any debts on it, about how much would you get?"

In Wave 1 and from Wave 3 to Wave 5, the questions ask:

- a) "Do you (or your (husband/wife/partner)) have any real estate (other than your main home / second home), such as land, rental real estate, a partnership, or money owed to you on a land contract or mortgage?"
- b) "If you sold all that and then paid off any debts on it, about how much would you get?"

From Wave 6 forward, "a partnership" is removed from the first question, and a qualifying statement is added, which says "Please do not include business or farm real estate.":

- a) "Do you (or your (husband/wife/partner)) have any real estate (other than your main home / second home), such as land, rental real estate, or money owed to you on a land contract or mortgage? Please do not include business or farm real estate."
- b) "If you sold all that and then paid off any debts on it, about how much would you get?"

If the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed net value of vehicles is assigned to HwATRAN. The HwAFTRAN variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

In Waves 1 and 2, ownership is based on whether a value is provided, since there is no direct question about ownership. However, we

also look at responses to the bracket questions. Those who did not provide any bracket information are set to "DK ownership."

Users should note the following outlier:

HHIDPN: 76856020 reported having transportation assets (QQ371) worth \$27,000,000 in Wave 14. The accuracy of this amount has been confirmed by HRS.

### Cross Wave Differences in Original HRS Data

The net value of vehicles in Wave 1 is based solely on the value of vehicles other than recreational vehicles. To include the value of recreational vehicles, please use H1WTRN2 from the cross-sectional imputations, which is available in the RAND HRS Detailed Imputations File.

The questions for Wave 1 are as follows:

From Section D:

- a) "Do you own a recreational vehicle or motor home?"
- b) "About how much is it worth, subtracting any money owed on it?"

From Section M:

- a) "What about the value of what you (or your (husband/wife/partner)) own wheels (other than the motor home we've already talked about), like cars, trucks, a trailer, a boat, or an airplane - what are they worth altogether, minus anything you still owe on them?"

From Wave 2 forward, the recreational vehicle question is dropped from the Housing section and instead included in the Net Worth section question. Only the value of vehicles from Net Worth section question is used to create HwATRAN.

The question appears as the following:

- a) "Do you (or your (husband/wife/partner)) own anything for transportation, like cars, trucks, a trailer, a motor home, a boat, or an airplane?"
- b) "What are they worth altogether, minus anything you still owe on them?"

In all waves if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed net value of businesses is assigned to HwABSNS. The HwAFBSNS variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

Users should note the following outlier:

HHIDPN: 543250020 reported having business or farm assets (QQ148) worth \$100,000,000 in Wave 14. The accuracy of this amount has been confirmed by HRS.

### Cross Wave Differences in Original HRS Data

The net value of businesses is asked in each wave. The question wording is similar in all waves, but the unfolding bracket questions vary. Two questions reveal whether the Respondent owns any businesses and if so, the value of them.

In Waves 1 and 2A, the questions ask:

- a) "Do you (or your (husband/wife/partner)) own part or all of a business?"
- b) "If you sold (all of) the business(es) and paid off any debts on (it/them), how much would you get?"

In Wave 2H the wording of the first question changes slightly to include "farm":

- a) "Do you (or your (husband/wife/partner)) own part or all of a farm or business?"

Beginning in Wave 3, the first question is almost identical to the Wave 2H version, and the second question adds the word "about":

- a) "Do you (or your (husband/wife/partner)) own part or all of a business or farm?"
- b) "If you sold all that and then paid off any debts on it, about how much would you get?"

Beginning in Wave 6, after the value of business or farm assets is collected, a question asks whether these assets were reported previously in the interview (e.g., HQ492). Beginning in Wave 9, a follow-up question was added which asks Respondents to indicate what percentage was previously reported (LQ523). For example, in Wave 9, about 30% of business owners indicate that they had reported their business wealth as one of the following: primary residence (which could be a farm or ranch), secondary residence, or other real estate earlier in the interview (LQ492 = yes). Of these business owners, most say that all of their business assets were previously reported (LQ523 = 100%).

The raw variables for these two questions are included in the RAND HRS Detailed Imputations File for the convenience of the analyst, and can be used for adjusting total wealth to reflect the amount of wealth that is twice reported. Q492 is available from Wave 6 forward, and Q523 is available from Wave 9 forward.

For the Q523 variables that are included in the RAND HRS Detailed Imputations File, we have recoded values of 998, 999, and -8 to .D (Don't Know), .R (Refuse), and .J (Web interview, missing), respectively. Since the answers to Q523 reflect percentages, using special missing codes in place of 998, 999, and -8 will allow users to generate more accurate descriptive statistics, based on a maximum value of 100.

The RAND HRS Detailed Imputations File can be downloaded from the [HRS website](#). The raw variables for these two questions are also included with the RAND HRS Fat Files.

In all waves, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed net value of all IRA and Keogh accounts is assigned to HwAIRA. HwAFIRA is a flag that indicates whether any components are imputed, and if so, how much information is available for imputation.

HwAIRA is the sum of components HwAIRA1, HwAIRA2, and HwAIRA3, which are each imputed separately. These variables, along with the associated imputation (HwAFIRA1, HwAFIRA2, HwAFIRA3) and ownership (HwAOIRA1, HwAOIRA2, HwAOIRA3) variables, are available in the RAND HRS Detailed Imputations File.

In Waves 3-5, Respondents who say DK/RF to the "how many accounts" question answer the questions in the first IRA loop, but then skip the questions in the remaining two IRA loops. HRS has confirmed that follow-up questions ask about "this account." Therefore, we assume these Respondents have only one account (IRA #1), and set ownership of the second (IRA #2) and third (IRA #3) accounts to "No asset."

In Waves 6-9, Respondents who say DK/RF to the "how many accounts" question skip the questions in all three IRA loops. Therefore, we treat these Respondents as owning one account (IRA #1), and set ownership of the second (IRA #2) and third (IRA #3) accounts to "DK ownership," in which case they undergo ownership imputation for the second and third accounts, and bracket/amount imputation if ownership is imputed.

From Wave 10 forward, Respondents who say DK/RF to the "how many accounts" question answer the questions in the first IRA loop, but then skip the questions in the remaining two IRA loops. However, the amount question in the first IRA loop asks about the total in these accounts at the present time. Therefore, the imputation methodology is the same as that for Waves 6-9, the only difference being that we ignore the bracket/amount imputations for the second (IRA #2) and third (IRA #3) accounts, and instead allocate the total from first account (IRA #1) to all accounts (depending on ownership) using a proportional allocation rule that allocates the reported/imputed amount for the first account to each owned IRA proportional to the amounts reported by all respondents who gave only continuous amounts, and who reported the same number of IRAs (i.e., two or three) as the current Respondent.

In waves where questions ask about multiple IRA accounts, HwAIRA represents the sum of the values of all of them.

Users should note the following outlier:

HHIDPN: 40407030 reported IRA assets in Section U (QU003\_9B) worth \$45,000,000 in Wave 14. The accuracy of this amount has been confirmed by HRS.

### Cross Wave Differences in Original HRS Data

The net value of IRA and Keogh accounts is asked in each wave. Two questions reveal whether the Respondent owns any IRA or Keogh accounts and if so, the value of them.

In Waves 1 and 2, the total of all IRA accounts is requested in one question:

- a) "Do you (or your (husband/wife/partner)) have any Individual Retirement Accounts, that is, IRA or Keogh accounts?"
- b) "How much in total is in all those accounts?"

Beginning in Wave 3, the questions ask about the two largest IRAs individually and then about all other IRAs collectively:

- a) "Do you (or your (husband/wife/partner)) currently have any money or assets that are held in an Individual Retirement Account, that is, in an IRA or KEOGH account?"
- b) "Let's talk about the (NEXT) largest IRA or KEOGH account/other IRA or KEOGH account/next largest IRA or KEOGH account/third IRA or KEOGH account/all the other IRA or KEOGH accounts. About how much is in this account at the present time?"

The second question is asked up to three times, depending on how many IRAs the Respondent reports (see the How Constructed section above for details about how Respondents who say DK/RF to this question are handled in the imputation process). For each IRA, Respondents are also asked who the account belongs to, except in Wave 3, where this question is asked only for the first two IRAs. We do not use this information when creating the ownership variables (HwAOvar).

In all waves, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed net value of stocks and mutual funds is assigned to HwASTCK. The HwAFSTCK variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

Users should note the following outlier:

HHIDPN: 529220010 reported having stock assets (OQ317) worth \$190,000,000 in Wave 12. The accuracy of this amount has been confirmed by HRS.

### Cross Wave Differences in Original HRS Data

The net value of stocks and mutual funds is asked in each wave. The question wording changes some after Wave 1, and the unfolding bracket questions vary. Two questions reveal whether the Respondent owns any stocks or mutual funds and if so, the value of them.

In Wave 1, the questions ask:

a) "For the next few questions, please exclude any assets held in the form of IRA and Keogh accounts. Do you (or your (husband/wife/partner)) have any shares of stock in publicly held corporations, mutual funds, or investment trusts?"

b) "If you sold all that and paid off anything you owed on it, how much would you have?"

Beginning in Wave 2, the first question changes to:

a) "(Aside from anything you have already told me about...) do you (or your (husband/wife/partner)) have any shares of stock or stock mutual funds?"

In all waves, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed value of checking, savings, and money market accounts is assigned to HwACHCK. The HwAFCHCK variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

## Cross Wave Differences in Original HRS Data

The net value of checking, savings, and money market accounts is asked in each wave. The question wording is similar in all waves, but the unfolding bracket questions vary. Two questions reveal whether the Respondent owns any checking, savings, or money market accounts and if so, the value of them.

In Wave 1, these questions ask:

- a) "Do you (or your (husband/wife/partner)) have any money in checking or savings accounts, or money market funds?"
- b) "If you added up all such accounts (for you and your (husband/wife/partner)), about how much would they amount to right now?"

Beginning in Wave 2, initial wording is added to the first question:

- a) "(Aside from anything you have already told me about...) do you (or your (husband/wife/partner)) have any money in checking or savings accounts, or money market funds?"

In all waves, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed net value of bonds or bond funds is assigned to HwABOND. The HwAFBOND variable indicates whether the value is imputed, and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

## Cross Wave Differences in Original HRS Data

The net value of bonds or bond funds is asked in each wave. The question wording is similar in all waves, but the unfolding bracket questions vary. Two questions reveal whether the Respondent owns any bonds or bond funds and if so, the value of them.

In Wave 1, the questions ask:

- a) "Do you (or your (husband/wife/partner)) have any corporate, municipal, government, or foreign bonds, or any bond funds?"
- b) "If you sold all those bonds or bond funds and paid off anything you owed on them, how much would you have?"

Beginning in Wave 2, initial wording is added to the first question:

- a) "(Aside from anything you have already told me about...) do you (or your (husband/wife/partner)) have any corporate, municipal, government, or foreign bonds, or any bond funds?"

In all waves, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed net value of all other savings is assigned to HwAOTHR. The HwAFOTHR variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

Users should note that there are two Respondents in Wave 6 who reported large values in Section U, much higher than their

reported amounts in Section Q.

1. HHIDPN: 10893010 reported no ownership for the asset "other personal items of value" in Section Q and a value of \$90,000,000 in Section U for the same asset.
2. HHIDPN: 131812010 reported a complete bracket of \$100,001+ in Section Q for the same asset type. However, in Section U a value of \$30,000,000 was reported.

Since the RAND HRS wealth imputation process uses the corrected Section U values when available, the final values for these 2 cases are 90 and 30 million dollars, respectively. Therefore, please use caution when drawing inferences about total wealth from Wave 6, as these 2 cases largely influence the total wealth values.

### Cross Wave Differences in Original HRS Data

The net value of all other savings is asked in each wave. The question wording is slightly different across waves and the unfolding bracket questions vary. Two questions reveal whether the Respondent owns any other savings funds and if so, the value of them:

In Wave 1, the questions ask:

- a) "Do you (or your (husband/wife/partner)) have any other savings or assets, such as money owed to you by others, a valuable collection for investment purposes, an annuity, or rights in a trust or estate that you haven't already told me about?"
- b) "If you sold all that and then paid off any debts on it, about how much would you have?"

In Wave 2, the wording to the initial question changes slightly:

- a) "Do you (or your (husband/wife/partner)) have any other savings or assets, such as jewelry, money owed to you by others, a collection for investment purposes, or an annuity that you haven't already told me about?"

Beginning in Wave 3, the initial question combines the wording found in Waves 1 and 2:

- a) "Do you (or your (husband/wife/partner)) have any other savings or assets, such as jewelry, money owed to you by others, a collection for investment purposes, rights in a trust or estate where you are the beneficiary, or an annuity that you haven't already told me about? EXCLUDE THE CASH VALUE OF ANY LIFE INSURANCE POLICIES"

In all waves, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket amounts and entry points vary across waves. In Wave 1, range card brackets may be coded instead of unfolding brackets.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed value of debt is assigned to HwADEBT. The HwAFDEBT variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

## Cross Wave Differences in Original HRS Data

The value of other debt is asked in each wave. The question wording is the same in all waves, but the unfolding bracket questions vary. Two questions reveal whether the Respondent has any other debt and if so, the value of it:

a) "And do you (or your (husband/wife/partner)) have any debts that we haven't asked about, such as credit card balances, medical debts, life insurance policy loans, loans from relatives, and so forth?"

b) "About how much would that amount to?"

From Wave 2 forward, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket ranges and entry points vary across waves. In Wave 1, no unfolding bracket questions are asked, though range cards could be used to obtain the value.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed value of the Respondent's primary residence is assigned to HwAHOUS. The HwAFHOUS variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

HwAHOUS is assigned from either HwAMOBL if the primary residence is a mobile home, or HwAHOU1 if not. HwAMOBL

and HwAHOU1 are imputed separately, and these variables, along with the associated imputation (HwAFHOU1, HwAFMOBL) and ownership (HwAOHOU1, HwAOMOBL) variables, are available in the RAND HRS Detailed Imputations File.

From Wave 3 forward to determine ownership of a primary residence, we look at responses to questions about whether the person is in a nursing home and if so, whether they own a home outside of the nursing home. In some cases, there is a discrepancy between what is reported on these questions and what was listed on the Tracker file, that is - some individuals said they were in a nursing home (and did not own a home outside of the nursing home), but the Tracker file said they were not in a nursing home. We considered the information from Tracker to be the most accurate.

Users should note the following outlier:

HHIDPN: 33562010 reported having a primary home (QH020) worth \$100,000,000 in Wave 14. The accuracy of this amount has been confirmed by HRS.

### **Cross Wave Differences in Original HRS Data**

The value of the primary residence is asked in each wave. Questions reveal whether the Respondent owns their primary residence and if so, the value of it.

In all waves, there are several questions which ask the Respondent about ownership of the residence and its value, depending on the type of home, e.g., a farm or ranch, mobile home, condominium, etc.

In Wave 1 the questions are asked in several places, all slightly different:

- a) "Do you (or your (husband/wife/partner)) own this (farm/ranch), do you own part of it, do you rent it, is it owned by a business, or what?"
- b) "Could you tell me the present value of this house and the immediately surrounding land? I mean, about what would it bring if it were sold today?"
- c) "Do you (or your (husband/wife/partner)) own both this mobile home and site or lot, do you own only the mobile home, do you own only the site, do you rent both the home and site, or what?"
- d) "Could you tell me the present value of this mobile home (and site)? I mean, about what would it bring if it were sold today?"
- e) "Do you (and your (husband/wife/partner)) own this (house and lot/apartment), do you rent, or what?"
- f) "What is the present value of this (home and land/apartment/property)? I mean, about what would it bring if it were sold today?"

In Waves 2 and 3 the ownership questions are slightly different and all branch to one value question:

- a) "Do you (and your (husband/wife/partner)) own your home, rent it, or what?"
- b) "Do you (or your (husband/wife/partner)) own this (farm/ranch), do you own part of it, do you rent it, or what?"
- c) "Do you (or your (husband/wife/partner)) own both the mobile home and site, do you own only the home, do you rent both the home and site, or what?"
- d) "What is its present value? I mean, about what would it bring if it were sold today?"

Beginning in Wave 4, the question wordings are the same but the question on mobile home value is a separate one from the value of a house or farm, and the unfolding brackets differ for the two types of property.

From Wave 2 forward, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket entry points vary across waves. In Wave 1, no unfolding bracket questions are asked, though range cards could be used to obtain the value.

In Waves 6 forward, some mobile home owners who did not report values were directed to the house value and subsequent bracket questions (if needed), which are different from those for mobile homes. Here, we imputed missing values using whichever series of brackets they were given. There were also some cases where values were given for both the mobile home and house questions. This is often the result of corrections from Section U. We checked all such cases and determined the most reasonable way to interpret the data. See Appendix B: Mobile Home/House Inconsistencies in the RAND HRS Detailed Imputations File Codebook available on the [HRS website](#) for more information.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed value of all mortgages is assigned to HwAMORT. HwAFMORT is a flag that indicates whether any components are imputed, and if so, how much information is available for imputation.

HwAMORT is the sum of the first and second mortgages (HwAMRT1, HwAMRT2), which are each imputed separately. These variables, along with the associated imputation (HwAFMRT1, HwAFMRT2) and ownership (HwaAOMRT1, HwaAOMRT2) variables, are available in the RAND HRS Detailed Imputations File.

Both a first and second mortgage can be reported in the data, though respondents may report having a second mortgage and not a first (i.e., one does not imply the other). The only exceptions are Waves 1 and 2A. In Wave 1, the survey questions only allow Respondents to report having a second mortgage if they have a first. In Wave 2A, Respondents who say "Someone else pays/DK/RF" to the question about the first mortgage (Are you paying anything on a mortgage or other loan on [this property]) can report having a second mortgage (though this does not occur). HwAMORT sums the first and second mortgages.

## Cross Wave Differences in Original HRS Data

The values of first and second mortgages are asked in each wave. Questions reveal whether the Respondent has a first and second mortgage and if so, the value of them.

In Wave 1, the questions ask:

- a) "Is there a mortgage or land contract on this (home and land/apartment/property)? (IF R ASKS, DO NOT INCLUDE HOME EQUITY LOANS OR LINES OF CREDIT)"
- b) "How much is still owed on this loan?"
- c) "In addition to your (mortgage/land contract) do you have a second mortgage or a land contract on this property? (Please do not include any home equity lines of credit.)"
- d) "How much is still owed on this loan?"

In Wave 2A, the questions ask:

- a) "Are you paying anything on a mortgage or other loan on [this property]?"
- b) "About how much do you still owe on this mortgage or loan?"
- c) "In addition to your mortgage or loan do you have a second mortgage or a land contract on this property?"
- d) "About how much do you still owe on that loan?"

Beginning in Wave 2H, the ownership questions cover first mortgage, second mortgage and other loans. Up to 3 loans may be specified:

- a) "Do you have a mortgage, land contract, second mortgage or any other loan that uses the property as collateral? Please do not include any home equity lines of credit."

Beginning in Wave 9, a qualifying statement was added to this question, which says "Do not include reverse mortgages."

- b) [If 1st mortgage] "About how much do you still owe on that mortgage or land contract?"
- c) [If 2nd mortgage] "About how much do you still owe on that second mortgage?"

From Wave 2H forward, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket entry points vary across waves. In Wave 1, no unfolding bracket questions are asked, though range cards could be used to obtain the value.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed value of other home loans is assigned to HwAHMLN. HwAFHMLN is a flag that indicates whether any components are imputed, and if so, how much information is available for imputation.

HwAHMLN is the sum of home equity line of credit balances and home equity loans (HwAEQCD, HwAEQLN), which are each imputed separately. These variables, along with the associated imputation (HwAFEQCD, HwAFEQLN) and ownership (HwAOEQCD, HwAOEQLN) variables, are available in the RAND HRS Detailed Imputations File.

## Cross Wave Differences in Original HRS Data

The values of home loans other than first and second mortgages are asked in each wave. Questions reveal whether the Respondent has any other home loans and if so, the value of them.

In Wave 1, questions ask about home equity loans and lines of credit, separately:

- a) "Do you have any (other) loans that use this property as collateral? (Please do not include any home equity lines of credit.)"
- b) "How much is still owed on this loan?"
- c) "Do you currently have a loan against this line of credit?"
- d) "How much is currently owed?"

In Wave 2A, one question is asked about other loans:

- a) "Do you have any (other) loans that use this property as collateral?"
- b) "About how much is still owed on this loan?"

Beginning in Wave 2H, the ownership questions cover first mortgage, second mortgage and other loans. Up to 3 loans may be specified:

- a) "Do you have a mortgage, land contract, second mortgage or any other loan that uses the property as collateral? Please do not include any home equity lines of credit."
- b) "About how much do you still owe on that loan?"

As in Wave 1, the Respondent is asked about a home equity line of credit separately:

- c) "Do you currently have a loan against this line of credit?"
- d) "About how much is currently owed?"

From Wave 3 forward, if the Respondent refuses or does not know the value of the home equity loans, a series of unfolding bracket questions are asked. The bracket ranges and entry points are the same across waves. From Wave 6 forward, unfolding bracket questions are asked for the value of a home equity line of credit. In Wave 1, no unfolding bracket questions are asked, though range cards could be used to obtain the value.

### General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

### How Constructed

The net value of housing HwATOTH is calculated as the value of the primary residence less mortgages and other home loans:

$$\text{HwATOTH} = \text{HwAHOUS} - \text{Sum}(\text{HwAMORT}, \text{HwAHMLN})$$

Users should note the following outlier:

HHIDPN: 33562010 reported having a primary home (QH020) worth \$100,000,000 in Wave 14, which is used in the calculation of H14ATOTH. The accuracy of this amount has been confirmed by HRS.

### **Cross Wave Differences in Original HRS Data**

See cross-wave differences for the components:

HwAHOUS = value of primary residence

HwAMORT = value of all mortgages/land contracts (primary residence)

HwAHMLN = value of other home loans (primary residence)

<b>Value of secondary residence</b>

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed value of the Respondent's second home is assigned to HwAHOUB. The HwAFHOUB variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

In Wave 2A, there was no separate information in the survey about the gross value of the second home and any loans on it, as this was included in the real estate question. Therefore, aside from H2AOHOUB (which indicates whether the household owns a second

home, and is available in the RAND HRS Detailed Imputations File), we did not attempt to create separate variables for this wave, and only provide the imputed net value of the second home, based on reconstructions and imputations by Cao and Juster (2004).<sup>35</sup> See the "Net value of secondary residence" section for more information.

For Wave 3, there was a skip pattern error, such that certain households with second homes were not asked the questions pertaining to these types of residences. Specifically, if the Coverscreen Respondent did not report living in a second home for at least two months during the year, the household was not asked questions about ownership and the value of a second home. For this wave, we provide H3AHOUB and H3AOHOUB (which indicates whether the household owns a second home, and is available in the RAND HRS Detailed Imputations File), based on reconstructions and imputations by Cao and Juster (2004)<sup>36</sup>, but not H3AFHOUB. See the "Net value of secondary residence" section for more information.

From Wave 4 forward, to determine ownership of a second home, we look at responses to questions about whether the person is in a nursing home and if so, whether they own a home outside of the nursing home. In some cases, there is a discrepancy between what is reported on these questions and what was listed on the Tracker file, that is - some individuals said they were in a nursing home (and did not own a home outside of the nursing home), but the Tracker file said they were not in a nursing home. We considered the information from the Tracker to be the most accurate.

Users should note the following outlier:

HHIDPN: 529220010 reported having a second home (OH166) worth \$65,000,000 in Wave 12. He also reported having a loan on this second home (OH171) of \$3,200,000. Therefore, the net value of his second home is \$61,800,000.

### **Cross Wave Differences in Original HRS Data**

The value of the second home is asked in each wave, though in some waves it is problematic. Questions reveal whether Respondents own their second home and if so, its value.

In Wave 1, the questions about second home ask:

a) "Do you (or your husband/or your wife/or your partner/. . . ) own a second home or condo? (TIME-SHARE WEEKS SHOULD BE INCLUDED.)"

b) "Could you tell me the present value of (your part of) that property – I mean, about how much would it bring if it were sold today?"

In Wave 2A, ownership of a second home is asked about within the context of real estate investments:

a) "Do you (or your (husband/wife/partner)) have any real estate (other than your main home), such as land, a second home, rental real estate, a partnership, or money owed to you on a land contract or mortgage?"

b) "If you sold all that and then paid off any debts on it, about how much would you get?"

In Wave 3, the questions about a second home are very similar to those for the primary home:

a) "Do you (and your husband/and your wife/and your partner) own that home, rent it, or what?"

b) "Do you (or your husband/or your wife/or your partner) own this farm/ranch), do you own part of it, do you rent it, or what?"

c) "Do you (or your husband/or your wife/or your partner) own both the mobile home and site, do you own only the home, do you rent both the home and site, or what?"

<sup>35</sup>Cao, H., and Juster, T. (2004). Correcting Second Home Equity in HRS/AHEAD: The Issues, a Method, and Some Preliminary Results. University of Michigan, Institute for Social Research. Available from the HRS website: <https://hrsdata.isr.umich.edu/data-products/hrsahed-second-home-ownership-and-equity-corrections>.

<sup>36</sup>Ibid.

d) "What is its present value. I mean, about what would it bring if it were sold today?"

In Wave 2H and from Wave 4 forward, the questions are consistent and the wordings are also the same:

a) "Not including investment property, do you (or your husband/or your wife/or your partner/...) own a second home or condo?"

b) "What is its present value? (What is the present value of your part of it?) I mean, about what would it bring if it were sold today?"

From Wave 2 forward, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket entry points vary across waves. In Wave 1, no unfolding bracket questions were asked, though range cards could be used to obtain the value.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The reported or imputed value of a second home mortgage (or other loans on it) is assigned to HwAMRTB. The HwAFMRTB variable indicates whether the value is imputed and if so, what level of information is available during the imputation process. A "1.continuous value" indicates that the Respondent reports an actual value and no imputation is necessary.

In Wave 2A, there was no separate information in the survey about the gross value of the second home and any loans on it, as this was included in the real estate question. Therefore, we did not attempt to create separate variables for this wave, and only provide

the imputed net value of the second home, based on reconstructions and imputations by Cao and Juster (2004).<sup>37</sup> See the "Net value of secondary residence" section for more information.

For Wave 3, there was a skip pattern error, such that certain households with second homes were not asked the questions pertaining to these types of residences. Specifically, if the Coverscreen Respondent did not report living in a second home for at least two months during the year, the household was not asked questions about ownership and the value of a second home. For this wave, we provide H3AMRTB and H3AOMRTB (which indicates whether the household has a second home mortgage, and is available in the RAND HRS Detailed Imputations File), based on reconstructions and imputations by Cao and Juster (2004)<sup>38</sup>, but not H3AFMRTB. See the "Net value of secondary residence" section for more information.

Users should note the following outlier:

HHIDPN: 529220010 reported having a second home (OH166) worth \$65,000,000 in Wave 12. He also reported having a loan on this second home (OH171) of \$3,200,000. Therefore, the net value of his second home is \$61,800,000.

### **Cross Wave Differences in Original HRS Data**

The value of a second home mortgage is asked in each wave, with the exception of Wave 2A. The manner in which the questions are asked varies across waves.

In Waves 1 and 2H, the questions about second home mortgage ask:

- a) "Do you owe any money on this property?"
- b) "About how much do you owe?"

In Wave 3, the questions about second home mortgages are very similar to those for the primary home:

- a) "Do you have a mortgage, land contract, second mortgage, or any other loan that uses the property as collateral? Please do not include home equity lines of credit."
- b) [If 1st mortgage] "About how much do you still owe on the mortgage or land contract?"
- c) [If 2nd mortgage] "About how much do you still owe on that second mortgage?"
- d) [If other loan] "About how much do you still owe on that loan?"
- e) [If home equity line of credit] "About how much is currently owed?"

Beginning in Wave 4, the questions are consistent. They are also similar to those in Wave 3 with the only difference being that all branch to one value question:

- a) "(Taking all mortgages and loans together,) about how much do you owe on your second home?"

From Wave 2H forward, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. The bracket entry points vary across waves. In Wave 1, no unfolding bracket questions are asked, though range cards could be used to obtain the value.

## General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The net value of second home HwANETHB is calculated as house value less mortgages:

$$HwANETHB = HwAHOUB - HwAMRTB$$

In Wave 2A, there was no information in the survey about the gross value of the second home and any loans on it. Therefore, we did not attempt to create the components H2AHOUB and H2AMRTB, and only provide the imputed net value of the second home, based on reconstructions and imputations by Cao and Juster (2004).<sup>39</sup>

<sup>39</sup>Ibid.

In Wave 3, there was a skip pattern error, such that certain households with second homes were not asked these questions. For this wave, we mostly used the reconstructions and imputations of the net value of the second home by Cao and Juster (2004)<sup>40</sup>, and derived H3AHOUB and H3AMRTB from these.

The imputation flag variables HwAFNETHB are only available for Wave 2A and Wave 3. These variables are not consistent with our usual imputation flags, but instead are hybrids that incorporate the work of Cao and Juster (2004)<sup>41</sup> as well as some modifications related to our own corrections and additions. See Appendix D: Second Homes in Wave 2A and Wave 3 in the RAND HRS Detailed Imputations File Codebook available on the [HRS website](#) for a description of the methodology we used to impute information about second homes in these waves.

Users should note the following outlier:

HHIDPN: 529220010 reported having a second home (OH166) worth \$65,000,000 in Wave 12. He also reported having a loan on this second home (OH171) of \$3,200,000. Therefore, the net value of his second home is \$61,800,000.

### **Cross Wave Differences in Original HRS Data**

See cross-wave differences for the components:

HwAHOUB = value of secondary residence

HwAMRTB = value of all mortgages/land contracts (secondary residence)

### General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

### How Constructed

The net value of non-housing financial wealth HwATOTF is calculated as the sum of the appropriate wealth components less debt:

$HwATOTF = \text{Sum}(HwASTCK, HwACHCK, HwACD, HwABOND, HwAOTHR) - HwADEBT$

Note: This total does NOT include the value of IRAs and Keogh plans, nor does it include the value of any real estate, vehicles, or businesses.

### **Cross Wave Differences in Original HRS Data**

See cross-wave differences for the components:

$HwASTCK$  = net value of stocks, mutual funds, and investment trusts

$HwACHCK$  = value of checking, savings, or money market accounts

$HwACD$  = value of CD, government savings bonds, and T-bills

$HwABOND$  = net value of bonds and bond funds

$HwAOTHR$  = net value of all other savings

$HwADEBT$  = value of other debt

### General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

### How Constructed

The net value of total wealth HwATOTB is calculated as the sum of all wealth components less all debt:

$HwATOTB = \text{Sum} (HwAHOUS, HwANETHB, HwARLES, HwATRAN, HwABSNS, HwAIRA, HwASTCK, HwACHCK, HwACD, HwABOND, HwAOTHR) - \text{Sum} (HwAMORT, HwAHMLN, HwADEBT)$

### **Cross Wave Differences in Original HRS Data**

See cross-wave differences for the components:

HwAHOUS = value of primary residence

HwANETHB = net value of secondary residence

HwARLES = net value of real estate (not primary residence)

HwATRAN = net value of vehicles

HwABSNS = net value of businesses

HwAIRA = net value of IRA, Keogh accounts

HwASTCK = net value of stocks, mutual funds, and investment trusts

HwACHCK = value of checking, savings, or money market accounts

HwACD = value of CD, government savings bonds, and T-bills

HwABOND = net value of bonds and bond funds

HwAOTHR = net value of all other savings

HwAMORT = value of all mortgages/land contracts (primary residence)

HwAHMLN = value of other home loans (primary residence)

HwADEBT = value of other debt

**Total Wealth (Excluding IRAs)**

### General Comments

Wealth measures are reported in nominal dollars. When an HRS or AHEAD wealth component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document.

The HRS and AHEAD wealth components are summed to create the wealth measures found here in the RAND HRS Longitudinal File. For each derived wealth measure, a flag indicates whether any or all of its components were imputed. Individual wealth components and imputation flags are available in the RAND HRS Detailed Imputations File.

### How Constructed

The net value of all non-housing wealth HwATOTN is calculated as the sum of the appropriate wealth components less debt:

$$\text{HwATOTN} = \text{Sum} (\text{HwARLES}, \text{HwATRAN}, \text{HwABSNS}, \text{HwAIRA}, \text{HwASTCK}, \text{HwACHCK}, \text{HwACD}, \text{HwABOND}, \text{HwAOTHR}) -$$

HwADEBT

Note that the value of the primary residence, secondary residence, mortgages, and home loans are NOT included.

### **Cross Wave Differences in Original HRS Data**

See cross-wave differences for the components:

HwARLES = net value of real estate (not primary residence)

HwATRAN = net value of vehicles

HwABSNS = net value of businesses

HwAIRA = net value of IRA, Keogh accounts

HwASTCK = net value of stocks, mutual funds, and investment trusts

HwACHCK = value of checking, savings, or money market accounts

HwACD = value of CD, government savings bonds, and T-bills

HwABOND = net value of bonds and bond funds

HwAOTHR = net value of all other savings

HwADEBT = value of other debt

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

For the HRS sample, R<sub>w</sub>IEARN is the sum of Respondent's wage/salary income, bonuses/overtime pay/commissions/tips, second job or military reserve earnings, and professional practice or trade income. For the AHEAD sample, Wave 2A R2IEARN includes only the income from earnings as asked and does not include specifics regarding bonuses, professional practice income, or second jobs. In Wave 3A, the calculation of R3IEARN includes wages, bonuses, and professional practice income but does not include income from a second job, as it was not asked in this wave. R<sub>w</sub>IFEARN is a flag that indicates whether any components are imputed, and if so, how much information is available for imputation.

SwIEARN and SwIFEARN are the analogous spouse variables.

The individual components: R<sub>w</sub>IWAGE, R<sub>w</sub>IBON, R<sub>w</sub>I2ND, R<sub>w</sub>ITRAD and their imputation flags (R<sub>w</sub>IFvar) are available in the RAND HRS Detailed Imputations File.

## Cross Wave Differences in Original HRS Data

The components of earnings remain the same across all HRS waves. However, there are fewer specific questions for the AHEAD sample. In Wave 2A, Respondents are only asked about last year's earnings from all jobs combined. The question was asked as follows: "About how much did you earn on all jobs in (1992/1993) before taxes?"

Wave 3A questions cover wages, bonuses, and professional practice income but did not ask about income from a second job.

From Wave 2H forward, if the Respondent refuses or does not know the value of an income component, a series of unfolding bracket questions are asked. The bracket amounts and entry points for some components vary across waves. In Waves 1 and 2A, no unfolding bracket questions are asked.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

HwICAP is the sum of household capital income received over the last calendar year, including business or farm income, self-employment earnings, gross rent, dividend and interest income, trust funds or royalties, and other asset income. In Waves 1 and 2H, gross rent is calculated from net rent plus rental expenses. HwIFCAP is a flag that indicates whether any components are imputed.

The components vary across waves because the survey questions ask about different components. From Wave 3-6, the components are the same, as is the case from Wave 7 forward. The components summed in each wave are:

H1ICAP sums income from business, rental property, dividend and interest, and trust fund or royalties.

H2ICAP sums income from business; stocks, bonds and other dividends; rental property; savings, CDs and other interest income; investment trusts; self-employment; and other investment income.

H3ICAP sums income from self-employment, business, rental property, stocks and mutual funds, bonds, CDs and treasury bills, checking and savings accounts, other assets, and trust fund or royalties.

H7ICAP contains the same components as those described for H3ICAP, except income from trust funds or royalties was not asked about from Wave 7 forward.

For income from business, there is a question beginning in Wave 3H that asks whether this income was reported earlier in the interview. If yes, the amount from business income is still imputed (or kept if an amount is present) but is NOT included in HwICAP, as it is assumed to be double-reported, usually as self-employment income.

The individual components are: HwIBUSIN, HwIRNTIN, HwITRSIN, HwIDIVIN, HwIBNDIN, HwISTK, HwICKIN, HwISAV, HwICDIN, HwIOTHIX and RWISEMP and their imputation flags are available in the RAND HRS Detailed Imputations File.

### **Cross Wave Differences in Original HRS Data**

The components of household capital income vary across waves.

Income from self-employment is not asked in Waves 1 and 2A but is added in Wave 2H. In Wave 2H, if the Financial Respondent reported they (Respondent only) were self-employed in the last wave, then they are asked how much they received in 1993. Then the Financial Respondent is asked if they or their spouse has received any other income privately-held businesses, farms, professional practices, or partnerships owned or shared by the Respondent and spouse. As a result, if the spouse was self-employed last wave or if the Respondent is newly self-employed, they will skip the first question and so their self-employment income will be bundled with the business income.

From Wave 3 forward, self-employment income is reported for the Respondent and spouse separately. In Waves 1 and 2H, one question asks about total interest and dividend income. Beginning in Wave 3, the survey adds separate questions about interest from bonds, CDs or treasury bills, and checking, savings, or money market accounts. Also added in Wave 3 are questions about income from other assets.

Most income from assets from Wave 3 forward ask for an amount, how often received, and whether it is the same amount each period. If the same amount is not received each period, then the total amount received last calendar year is asked. If the same amount is received each period, then the amount is multiplied appropriately for the period to arrive at the total per year. Beginning in Wave 3, questions ask the income from assets immediately following questions on whether the asset is owned. If no asset is owned, then income from the asset is assumed to be \$0. In Waves 1 and 2, income from assets questions are asked in a completely different section of the interview.

From Wave 2H forward, with the exception of trust fund income, if the Respondent refuses or does not know the value of an income component a series of unfolding bracket questions are asked. The bracket amounts for income from business, rental property, and dividends or interest change from Wave 2H to 3. The entry points for some components vary across waves. In Waves 1 and 2A, no unfolding bracket questions are asked.

The income questions in Wave 2A are very different from other waves. Most distinctive are the "regular income" for Respondent and spouse and "other household income." After standard questions about Social Security income, SSI and food stamps, other income is asked about in a general way. If other income is present, Respondents are asked to specify the source of income. In other waves, most income types are asked specifically (e.g., Do you receive income from stocks?).

In Wave 2A, Financial Respondents are asked the following questions about their own income and then are asked about their spouse's income:

a) "Do you receive any (other) regular income payments; for example, from retirement pensions, Veterans Benefits, annuities, payments from an IRA account, or anything like that?"

b) "Please think about the largest (other) regular income you receive. What type of income is that?"

[IWER: PROBE WITH CATEGORIES ONLY IF R NEEDS HELP]

1.VETERANS BENEFITS

2.RETIREMENT OR OTHER PENSIONS

3.ANNUITY

4.IRA DISTRIBUTION

5.STOCKS AND BONDS

7.OTHER

8.DK

9.RF

This set of questions is repeated twice so that Respondents can report up to 3 current other regular incomes. Then they are asked:

a) "Did you receive any other regular income in (last calendar year) that you no longer receive?"

b) "What type of income was that?"

(Same categories as above)

So there are a total of 4 other regular incomes that can be reported. Categories may be specified more than once, and there are up to 3 different instances of an income like pensions or stocks. Besides pensions and annuities, other waves allow only one reported amount for most income categories, so that a Respondent would give a total of all dividend income received.

Financial Respondents are then asked the following questions about their household income:

a) "(Aside from anything you have already told me about,) Do you (or your (husband/wife/partner)) receive any income from financial investments like savings accounts, CDs, stocks and bonds, rental property, or investment trusts?"

b) "What do you receive the largest income from?"

[IWER: PROBE WITH CATEGORIES ONLY IF R NEEDS HELP]

1.SAVINGS ACCOUNTS/CDs/INTEREST

2.STOCKS OR BONDS/DIVIDENDS

3.RENTAL PROPERTY

4.INVESTMENT TRUSTS

5.RELATIVE

7.OTHER

8.DK

9.RF

This set of questions is repeated once so that Respondents can report up to 2 current household investment incomes. Then they are asked:

a) "Did you (or your (husband/wife/partner)) receive any income from savings or investments in (last calendar year) that you no longer receive?"

b) "What did you receive that income from?"

So there are a total of 3 household investment incomes that can be reported. Categories may be specified more than once, and there are up to 2 different instances of an income like savings.

If income is received, subsequent questions serve to identify the date of receipt (was income received in last calendar year?) and amount received. There are no unfolding brackets for income in Wave 2A.

Resulting Wave 2A Household Capital Income components:

Respondent/Spouse or Partner (R/S)

ISTK1-3

Household (H)

ISAV1-2

ISTK1-2

IRNT1-2

ITRS1-2

IOTH1-5

Please note that Wave 2A IRA distributions are now grouped with IRA withdrawals and are no longer included among household capital income components, as they were in previous versions of this file. See the "IRA Withdrawals" section for more information.

In Wave 6, the introductory question wording for real estate ownership differs from previous waves. Up until Wave 6, the question reads:

"Do you (or your husband/or your wife/or your partner/...) have any real estate (other than your main home or second home), such as land, rental real estate, a partnership, or money owed to you on a land contract or mortgage?"

The new question wording is as follows:

"Do you and (your (husband/wife/partner)) have any real estate (other than your main home or second home/other than your main home/other than your second home,) such as land, rental real estate, or money owed to you on a land contract or mortgage? Please do not include business or farm real estate."

From Wave 7 forward, income from trust funds or royalties was not asked about. Therefore, this type of income is not included among the components that are used to derive household capital income.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

RwIPENA is the sum of the Respondent's income from all pensions and annuities. RwIPEN is the Respondent's income from all pensions. RwIANN is the Respondent's income from all annuities. RwIFPEN is a flag that indicates whether any components are imputed. RwIFPEN and RwIFANN are flags that indicate whether any components are imputed in the separate measures.

SwIPENA, SwIPEN, SwIANN, SwIFPEN, SwIFPEN and SwIFANN are the analogous spouse variables.

Pension amounts are obtained separately for the Financial Respondent and spouse in all waves. In Wave 1, there is one annual amount for all pension income. From Wave 2 forward, up to 3 monthly amounts can be reported for pensions. The month the Respondent or spouse first received the pension is asked for the first 2 pensions. Annuity income questions are asked in the same way as pensions.

Beginning in Wave 2, the start month is checked for the first 2 pensions or annuities, and the appropriate number of months are used to calculate yearly income. For the third monthly amount reported, no start month is available beginning in Wave 2H, and the monthly amount is multiplied by 12 months.

Users should note a few outliers who required further examination:

1. HHIDPN: 10013010 reported receiving a (monthly) first pension (LQ220\_1) of \$5,000,000 in Wave 9. Multiplying this amount by 12 months results in \$60,000,000 annually from this pension alone. The accuracy of this amount has been confirmed by HRS.
2. HHIDPN: 79230030 reported receiving a (monthly) first pension (LQ246\_1) of \$600,000 in Wave 9. Multiplying this amount by 12 months results in \$7,200,000 annually from this pension alone. HRS has stated that the reported amount is a lump sum. However,

examination of other questions suggest that this pension started in 2003 (LQ257\_1). Therefore, we have decided to consider this a monthly amount, which again will result in the large annual total stated above.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, income is reported as the total amount received in 1991 from all pensions. Pension income is reported separately for Respondent and spouse. From Wave 2 forward, monthly income from up to 2 pensions are asked about individually, and monthly income from any additional pensions are reported as a 3rd amount. These three amounts are reported separately for Respondent and spouse. Also, beginning in Wave 2, the month the Respondent or spouse first received the pension is asked for the first two pensions. The same is true for annuities.

Beginning in Wave 2, the start month is checked for the first 2 pensions or annuities, and the appropriate number of months are used to calculate yearly income. For the third monthly amount reported, no start month is available beginning in Wave 2H, and the monthly amount is multiplied by 12 months.

Beginning in Wave 3H, if the Respondent refuses or does not know the amount received last month from the first 2 pensions and annuities, a series of unfolding bracket questions are asked. The bracket amounts and entry points are the same across waves. In Waves 1, 2, and 3A, no unfolding bracket questions are asked. Beginning in Wave 6, bracket questions are asked for the third pension and annuity.

Beginning with Wave 10, those who report receiving \$0 in the last month for their first or second annuities are asked if they received any income in the last year and the amount in total that they received.

The income questions in Wave 2A are very different from other waves. Most distinctive are the "regular income" for Respondent and spouse and "other household income". After standard questions about Social Security income, SSI and food stamps, other income is asked about in a general way. If other income is present, Respondents are asked to specify the source of income. In other waves, most income types are asked specifically (e.g., Do you receive pension income?).

In Wave 2A, Financial Respondents are asked the following questions about their own income then their spouse's:

a) "Do you receive any (other) regular income payments; for example, from retirement pensions, Veterans' Benefits, annuities, payments from an IRA account, or anything like that?"

b) "Please think about the largest (other) regular income you receive. What type of income is that?"

[IWER: PROBE WITH CATEGORIES ONLY IF R NEEDS HELP]

1.VETERANS BENEFITS

2.RETIREMENT OR OTHER PENSIONS

3.ANNUITY

4.IRA DISTRIBUTION

5.STOCKS AND BONDS

7.OTHER

8.DK

9.RF

This set of questions is repeated twice so that Respondents can report up to 3 current other regular incomes. Then they are

asked:

a) "Did you receive any other regular income in (last calendar year) that you no longer receive?"

b) "What type of income was that?"

(Same categories as above)

So there are a total of 4 other regular incomes that can be reported. Categories may be specified more than once, and there are up to 3 different instances of pension income and up to 2 different reports of annuity income.

If income is received, Financial Respondents are then asked questions that serve to identify the frequency (was that paid to you monthly?), amount received (how much did you receive last (month/period/year) from that?), and when payments were stopped (what month did you stop receiving that?). There are no unfolding brackets for income in Wave 2A.

Beginning in Wave 10, if a Respondent states they are currently receiving an annuity and that the amount received last month was \$0, they are asked if any income was received last year and the total amount received last year. If provided, we apply the total amount received last year as the annual amount from the LCY and also use it to estimate a monthly amount.

An examination of the pension income (RwIPEN) variables in RAND HRS Version O showed markedly lower average pension income in Wave 11 compared to Wave 10. After a thorough analysis, we have concluded that this is largely due to the introduction of a new Pension Section (J2) in the 2012 questionnaire, which precedes and therefore affects some answers in the Assets and Income Section (Q). Because the question about pension income in the Assets and Income Section uses the wording "Not including Social Security or other retirement income you've already told me about," some Financial Respondents did not report pension income they had reported earlier in the Pension Section. This interaction between different sections of the surveys was not intended by the survey designers.

To remedy this problem in the data, we incorporate logic in Waves 11 forward to pull information about pension income of Financial Respondents from both Section Q and Section J2 of the questionnaire. We did not change the derivation of pension income for earlier waves, because those did not yet have the Pension Section (J2) that caused the interaction with the pension income questions in Section Q. Pension income for earlier waves continues to be calculated using only information from Section Q. See Appendix C: Combining Pension Income from Section Q (Assets & Income) and Section J2 (Pension) in the RAND HRS Detailed Imputations File Codebook available on the [HRS website](#) for a detailed description of the methodology that we developed for combining information from the Pension Section (J2) and the Income Section (Q).

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

RwISSDI is the sum of the Respondent's income from Social Security disability (SDI) and Supplemental Security income (SSI) in the last calendar year. SSI income is always included in the sum, but Social Security income is only included in the sum if it is received due to disability. Income from SDI and SSI are available separately in RwISDI and RwISSI. RwIFSSDI is a flag that indicates whether any components are imputed in the combined measure. RwIFSDI, RwIFSSI, and HwIFSSI flag whether these components are imputed, and if so, how much information is available to impute from.

RwISDI is the portion of RwISSDI that represents the Respondent's Social Security disability income, and RwISSI is the portion that represents the Respondent's income from SSI. RwISSDI is equal to the sum of RwISDI and RwISSI.

SwISSDI, SwISDI, SwISSI, SwIFSSDI, SwIFSDI and SwIFSSI are the analogous spouse values.

In Waves 1 and 2H, SSI income is reported individually. In Wave 2A and from Wave 3 forward, it is reported for the household. In a single household, it is assigned to the Respondent. In couple households in Waves 2A and 3A, the household amount is split evenly between the Respondent and spouse. That is, RwISSI is the same as SwISSI, and both are equal to household SSI divided by two ( $RwISSI = SwISSI = SSI / 2$ ). In couple households in Waves 3H forward, it is allocated to the Respondent and/or spouse using an HRS Core Interview variable indicating who received income from SSI. If that variable is missing or indicates both Respondent and spouse jointly received income from SSI, the household amount is split evenly between the Respondent and spouse. RwISSI and SwISSI reflect the last calendar year (LCY) amounts allocated to Respondent and spouse, respectively.

In Waves 1, 2, and 3A, the type of Social Security income received is asked. The type can be retirement, disability, survivor benefits, dependent of retired, dependent of disabled or other, and Respondents can name up to two different types. The total Social Security income amount is reported, rather than separated by types received. Therefore, we decided that if a person reports receiving disability income, even if they also report getting another type of income from Social Security, the amount they indicated would be considered disability income. In Wave 1, if a joint check is received, the type is not asked and is assumed to be retirement income unless disability income is otherwise indicated. From Wave 3H forward, the type of Social Security income is not asked. Instead, variables in the disability section indicating whether the Respondent and spouse receive Social Security disability are used to determine whether Social Security reported in the income section is disability income.

In Waves 1 and 2H and from Wave 3H forward, we incorporated logic that examines the ages of Respondents and spouses. For those who have reached full retirement age at the time of the interview and receive Social Security disability income, we override the disability income and assign it instead retirement income. This is based on the notion that disability benefits automatically convert to retirement benefits at full retirement age.

In Wave 1, the questions ask the annual amount of Social Security and SSI received in 1991. From Wave 2 forward, a monthly amount is asked. For Social Security, the first month received is also asked. Beginning in Wave 2H, the SSI questions ask which months since last interview SSI was received. The variable derivation checks the month income was received and multiplies the monthly amount appropriately to calculate a yearly amount.

### **Cross Wave Differences in Original HRS Data**

The way the Social Security and Supplemental Security Income questions are asked varies across waves.

In Wave 1, the questions asked the annual amount of Social Security and SSI received in 1991. In Wave 1 and Wave 2A, if the Respondent and spouse received a joint check for Social Security, only one amount is asked; if they received separate checks, amounts were asked for each individual. From Wave 2 forward, a monthly amount is asked. For Social Security the first month received is also asked. Beginning in Wave 2H, the SSI questions ask which months since the last interview SSI was received. The variable derivation checks that the monthly income was received and multiplies the monthly amount appropriately to calculate a yearly amount.

From Wave 3 forward, if the Respondent refuses or does not know the value of monthly Social Security or Supplemental Security income, a series of unfolding bracket questions are asked. The bracket amounts for Social Security income change in Wave 5 but otherwise are the same across waves. The exception to this is in Wave 3A, where the bracket amounts are based on the last year rather than the last month. In Waves 1 and 2, no unfolding bracket questions are asked.

Beginning in Wave 6, there are two possible sources of information about whether the spouse receives Social Security: (1) the Financial Respondent's report in the HRS Income section (Section Q); and (2) the spouse's self-report in the Employment section (Section J). To determine whether the spouse has any Social Security income, we use the spouse's self-report. However, if the spouse did not respond, or the self-report is missing, we use the Financial Respondent's report. Our rationale for doing this is that the self-report is probably more accurate. It is also important to note that the self-report in the employment section is the only explicit question about whether the Financial Respondent currently receives Social Security income.

From Wave 7 forward, an additional response option ("6. SSDI HAS CONVERTED TO SOCIAL SECURITY (VOL)") was added to the following question, which helped us determine whether the type of Social Security income being received was for retirement or disability:

"According to our records...you were receiving benefits from the Social Security Disability program or the Supplemental Security Income program. Which program was this: the Social Security Disability or the Supplemental Security Income program, or both?"

For Respondents who reported a conversion, we added logic to check the ages of these individuals before designating them as receiving Social Security retirement income. Specifically, to designate as retirement income instead of disability income, we required that a person be full retirement age at the time of the interview or have an end year for their Social Security income before the last calendar year.

Because of the differences in the way income information was collected for the HRS and AHEAD samples in Wave 2, the

income component imputation flags that apply vary, depending on the entry cohort of the Respondent. For AHEAD entry cohort Respondents, R2IFSSI and S2IFSSI are set to .Q to indicate that the corresponding income components are not available in Wave 2A. For HRS entry cohort Respondents, H2IFSSI is set to .Q to indicate that the corresponding income components are not available in Wave 2.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

RwISRET is the Respondent's income from Social Security retirement, spouse, or widow benefits in the last calendar year (LCY). RwIFSRET is a flag that indicates whether any components are imputed.

SwISRET and SwIFSRET are the analogous spouse variables.

In Waves 1 and 2A, Social Security income could be reported individually or, if the Respondent is married, jointly. If the income is reported jointly, the income is split between the Respondent and spouse.

In Wave 1, the questions ask the annual amount of Social Security received in 1991. From Wave 2 forward, a monthly amount is asked and the first month received is also asked. The variable derivation checks the months income was received and multiplies the monthly amount appropriately to calculate a yearly amount.

In Waves 1, 2, and 3A, the type of Social Security income received is asked. The type can be retirement, disability, survivor benefits, dependent of retired, dependent of disabled or other, and Respondents can name up to two different types. The total Social Security income amount is reported, rather than separated by types received. Therefore, we decided that if a person reports receiving any type of income from Social Security EXCEPT disability, the amount they indicated would be considered retirement income. In Wave 1, if a joint check is received, the type is not asked and is assumed to be retirement income unless disability income is otherwise indicated. Similarly, from Wave 3H forward, the type of Social Security income is not asked and is assumed to be retirement income unless disability income is indicated in the disability section of the questionnaire.

RwISRET and SwISRET only include Social Security income if it is NOT received due to disability.

In Waves 1 and 2H and from Wave 3H forward, we incorporated logic that examines the ages of Respondents and spouses. For those who have reached full retirement age at the time of the interview and receive Social Security disability income, we override the disability income and assign it instead retirement income. This is based on the notion that disability benefits automatically convert to retirement benefits at full retirement age.

## Cross Wave Differences in Original HRS Data

The way the Social Security income questions are asked varies across waves.

In Wave 1, the questions ask the annual amount of Social Security received in 1991. In Wave 1 and Wave 2A, if the Respondent and spouse receive a joint check only, one amount is asked; if they receive separate checks, amounts are asked for each individual. From Wave 2 forward, a monthly amount is asked. The first month Social Security received is also asked.

In Waves 1, 2, and 3A, the type of Social Security income received is asked. The type can be retirement, disability, survivor benefits, dependent of retired, dependent of disabled or other. In Wave 1, if a joint check is received, the type is not asked. From Wave 3H forward, the type of Social Security income is not asked.

From Wave 3 forward, if the Respondent refuses or does not know the value of monthly Social Security income, a series of unfolding bracket questions are asked. The bracket amounts for Social Security income change in Wave 5 but otherwise are the same across waves. The exception to this is in Wave 3A, where the bracket amounts are based on the last year rather than the last month. In Waves 1 and 2, no unfolding bracket questions are asked.

Beginning in Wave 6, there are two possible sources of information about whether the spouse receives Social Security: (1) the Financial Respondent's report in the HRS Income section (Section Q); and (2) the spouse's self-report in the Employment section (Section J). To determine whether the spouse has any Social Security income, we use the spouse's self-report. However, if the spouse did not respond, or the self-report is missing, we use the Financial Respondent's report. Our rationale for doing this is that the self-report is probably more accurate. It is also important to note that the self-report in the employment section is the only question about whether the Financial Respondent receives Social Security income.

From Wave 7 forward, an additional response option ("6. SSDI HAS CONVERTED TO SOCIAL SECURITY (VOL)") was

added to the following question, which helped us determine whether the type of Social Security income being received was for retirement or disability:

"According to our records...you were receiving benefits from the Social Security Disability program or the Supplemental Security Income program. Which program was this: the Social Security Disability or the Supplemental Security Income program, or both?"

For Respondents who reported a conversion, we added logic to check the ages of these individuals before designating them as receiving Social Security retirement income. Specifically, to designate as retirement income instead of disability income, we required that a person be full retirement age at the time of the interview or have an end year for their Social Security income before the last calendar year.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

RwIUNWC sums the Respondent's income from unemployment and worker's compensation. Income from unemployment and worker's compensation are available separately in RwIUNEM and RwIWCMP. RwIFUNWC is the imputation flag that indicates whether any components are imputed, and if so, how much information is available for imputation.

RwIFUNEM and RwIFWCMP indicate whether the Respondent's component is imputed.

SwIUNWC, SwIUNEM, SwIWCMP, SwIFUNWC, SwIFUNEM and SwIFWCMP are the analogous spouse variables.

Unemployment and worker's compensation are not available for AHEAD Respondents in Waves 2A and 3A. RwIUNWC and SwIUNWC are set to .Q for all AHEAD Respondents in these waves. Same for RwIUNEM, RwIWCMP, SwIUNEM and SwIWCMP. RwIFUNWC and SwIFUNWC are set to .Q to flag the cases where this is done. Same for RwIFUNEM, SwIFUNEM, RwIFWCMP and SwIFWCMP.

## Cross Wave Differences in Original HRS Data

The unemployment and worker's compensation questions are asked in all HRS waves for Respondent and spouse. The question wording varies slightly. In AHEAD (Waves 2A and 3A), there are no questions about unemployment and worker's compensation.

In Wave 1, the questions ask for income received in 1991. In Wave 2H, the questions ask for income received in 1993. Beginning in Wave 3H, the questions ask for income received in the last calendar year. The last calendar year is the year before the year of the interview.

The question about the amount received is:

"How much did you receive in (year)?"

Beginning in Wave 4, the question changes slightly to:

"How much did you receive in (year) (before taxes and other deductions)?"

In Wave 5, Respondents who are 65 years of age or older and report not working for pay in the last calendar year skip the questions about income from unemployment and worker's compensation. Respondents who are under 65 years of age, on the other hand, are asked both sets of questions, even if they are not working. From Wave 6 forward, the same pattern is true for Respondents who are 65 years of age or older. However, those who are under 65 years of age and report not working for pay in the last calendar year are asked the questions about income from unemployment but skip those related to worker's compensation.

Beginning in Wave 6, unfolding bracket questions are asked for unemployment and worker's compensation.

For AHEAD Respondents in Waves 2A and 3A, the income components corresponding to imputation flags R2IFUNEM, R2IFWCMP, S2IFUNEM, S2IFWCMP, R3IFUNEM, R3IFWCMP, S3IFUNEM, and S3IFWCMP are not available.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

RwIGXFR sums the Respondent's income from veterans' benefits, welfare, and food stamps. RwIFGXFR is a flag that indicates whether any components are imputed, and if so, how much information is available for imputation.

SwIGXFR and SwIFGXFR are the analogous spouse variables.

Veterans' benefits and food stamps are given as monthly amounts, which are multiplied by the appropriate number of months to derive the amount received in the last calendar year. For veterans' benefits, when we know the income was first received last calendar year, but no month information is available, we assume 6 months. Prior to Wave 10, we assumed 12 months. When neither the year of first receipt nor the months are known, we use 12 months.

For food stamps, when we know the income was received last calendar year, but no month information is available, we assume 6 months, accounting for the fact that this benefit is not necessarily received for an entire year and that households may not receive food stamps when their economic circumstances change. Prior to Wave 10, we assumed 12 months, and in Wave 10, we inadvertently used 0 months. When the Respondent reports receiving food stamps sometime since the last interview or in the last two years, but we know neither the year nor the month of receipt, we assume 6 months as well. Prior to Wave 11, we assumed 12 months. The assumptions that were used prior to Wave 11 will be updated as necessary in a future data release.

In all waves, veterans' benefits are reported individually and food stamps are reported for the household. In Wave 1, and from Wave 3 forward, welfare is reported for the household, but in Wave 2H it is reported individually. In Wave 2A, it is not reported at all.

Welfare income is split between the Respondent and spouse if the Respondent is married or partnered and the income is reported jointly. However, income from welfare is not split between the two members of the couple if only one reports receiving it, that is - it is assigned to the appropriate recipient. This logic does not apply for Wave 2H, since income from welfare is already reported individually. Nor does it pertain to Wave 2A, since there is no direct question about income from welfare. Income from food stamps is always divided equally between the Respondent and spouse.

In Wave 1, the questions ask the amount of veterans' benefits and food stamps received in 1991. From Wave 2 forward, a monthly amount is asked. For veterans' benefits the first month received is also asked. Beginning in Wave 2H, the questions about food stamps ask which months they were received since the last interview. The variable derivation checks the months income was received and multiplies the monthly amount appropriately to calculate a yearly amount.

The individual components: RwIVET, R2IVETn, HwIFOOD, R2IWELF, and HwiWELF and their imputation flags are available in the RAND HRS Detailed Imputations File.

## Cross Wave Differences in Original HRS Data

The way the income component questions are asked varies across waves.

In all waves, veterans' benefits are reported for Respondent and spouse individually, and food stamps are reported for the household. In Wave 1, and from Wave 3 forward, welfare is reported for the household, but in Wave 2H it can be reported individually or, if both the Respondent and spouse receive it, jointly.

In Wave 1, the questions ask for the annual amount of veterans' benefits and food stamps received in 1991. From Wave 2 forward, the amount of veterans' benefits received last month and the amount of food stamps in the latest month received are asked. For veterans' benefits the first month received is also asked. Beginning in Wave 2H, the questions about food stamps ask which months since last interview they were received. For welfare the question asks for the annual amount in all waves. Beginning in Wave 6, bracket amounts are asked for welfare, food stamps, and transfer income.

From Wave 3 forward, if the Respondent refuses or does not know the value of monthly veterans' benefits, a series of unfolding bracket questions are asked. The bracket amounts are the same across waves. The exception to this is in Wave 3A, where the bracket amounts are based on the last year, rather than the last month. In Waves 1 and 2, no unfolding bracket questions are asked.

The income questions in the Wave 2A are very different from other waves. Most distinctive are the "regular income" for Respondent and spouse and "other household income." After standard questions about Social Security income, SSI and food stamps, other income is asked about in a general way. If other income is present, Respondents are asked to specify the source of income. In other waves, most income types are asked specifically (eg, Do you receive veterans' benefits?).

In Wave 2A, Financial Respondents are asked the following questions about their own income then their spouse's:

- a) "Do you receive any (other) regular income payments; for example, from retirement pensions, Veterans Benefits, annuities, payments from an IRA account, or anything like that?"
- b) "Please think about the largest (other) regular income you receive. What type of income is that?"

[IWER: PROBE WITH CATEGORIES ONLY IF R NEEDS HELP]

1.VETERANS BENEFITS

2.RETIREMENT OR OTHER PENSIONS

3.ANNUITY

4.IRA DISTRIBUTION

5.STOCKS AND BONDS

7.OTHER

8.DK

9.RF

This set of questions is repeated twice so that Respondents can report up to 3 current other regular incomes. Then they are asked:

- a) "Did you receive any other regular income in (last calendar year) that you no longer receive?"
- b) "What type of income was that?"

(Same categories as above)

So there are a total of 4 other regular incomes that can be reported. Categories may be specified more than once, and there are up to 2 different instances of veterans' benefits. Besides pensions and annuities, other waves allow only one reported amount for most income categories, so that a Respondent would give a total of all veterans' benefits income received.

If income is received, subsequent questions serve to identify the date of receipt (was income received in last calendar year?) and amount received. There are no unfolding brackets for income in Wave 2A.

In Wave 12, there are 64 Respondents who report receiving food stamps (OQ400 = 1), have missing (.) values for the "year received food stamps" questions (OQW776\_1, OQW776\_2, OQW776\_3, OQW776\_4), but do answer the "amount received" questions (OQ406 or OQ410). According to HRS, this is due to a programming oversight, resulting in the OQW776 questions being skipped for Respondents who completed the survey in 2015. We assume that these Respondents received food stamps for 6 months in the last calendar year.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

HwIOTHR sums alimony, other income, and lump sums from insurance, pension, and inheritance. HwIFOTHR is a flag that indicates whether any components are imputed, and if so, how much information is available for imputation.

In Wave 1, lump sum income from pensions, insurance, and inheritance are available. Beginning in Wave 2, the questions about lump sum income are generic, but the type and the year in which the lump sum was received are also asked. Only amounts reported as being received from insurance, pension, and inheritance in the last calendar year are included here.

In Waves 1 and 2A, income from friends and family are reported. In later waves, income from friends and family is specifically excluded in question wording about other income. For consistency, income from friends and family are NOT included in this income measure.

For Wave 2A, and from Wave 7 forward, income from alimony (or child support payments) was not asked about. Therefore, this type of income is not included amongst the components that are used to derive other household income.

The individual components: HwIALMNY, HwILUYRn, HwIOTHIn and their imputation flags are available in RAND HRS Detailed Imputations File.

### **Cross Wave Differences in Original HRS Data**

The way that some of the income component questions are asked may vary across waves. The questions about lump sum income and other household income change across waves, while the questions on alimony remain the same across waves through Wave 6. Beginning in Wave 7 forward, the question about alimony is not asked.

In Wave 1, questions in the income section ask three separate questions, one for each type of lump sum:

"Did you (or your (husband/wife/partner)) receive a lump sum of money in 1991 from (pensions, insurance, inheritance)?"

In Wave 2, the lump sum income questions are asked in the assets section of the questionnaire:

"People sometimes receive property or lump sum payments of money from such things as pension settlements, insurance settlements, cashing in annuities, or inheritances. In the past two years did you (or your (husband/wife/partner)) receive a lump sum of money or property worth \$500 or more that you have not already told me about? Do not include loans or gifts."

The Wave 3 question wording is similar to that in Wave 2H. Instead of "the past two years," the wording is "since (previous interview month)" if the Respondent has a previous interview. Also the words "worth \$500" are dropped.

Beginning in Wave 4, the question wording is:

"People sometimes receive large amounts of property or money in the form of an inheritance, a trust fund, an insurance settlement, and so on. Have you (or your spouse/partner) (ever/since last interview) received money or property in the form of an inheritance, a trust fund, or an insurance settlement?"

Note that the word "large" is included and the reference period is "ever" if this is the Respondent's first interview. A note to the interviewer indicates that "large" means \$10,000 or more.

From Wave 2 forward, the type of payment and month received are asked and questions about any other lump sum, one or two more times. The amount question asks about the largest or next largest lump sum. Thus the amounts of the three largest lump sums are available.

Other household income is derived from questions about any other income not asked about specifically. In Waves 1 and 2A, there is also a question about income from friends and family. In later waves, income from friends and family is specifically excluded in question wording about other income.

The question wording for other income varies across waves. In Wave 1, the question asks:

"Any other income from sources other than Social Security, which I'll ask about next?"

In Wave 2H, two questions ask about other income:

1. "(Other than income you have already told me about, did you (and your (husband/wife/partner)) receive any other income in 1993, for example, from private disability insurance payments, consulting fees, odd jobs, and so forth? (DO NOT INCLUDE FINANCIAL SUPPORT FROM RELATIVES OR FRIENDS.)"
2. "Are there any others?"

In Wave 3H forward, only one question about other income is asked and the wording is similar to that in the first question in Wave 2H, except that "rent from your home or second home" is added to the list of examples. In Wave 3A, the question wording is also similar to that in the first question in Wave 2H, except that "consulting fees" is removed from the list of examples. Beginning in Wave 4, the question that actually asks for the amount received adds the words "before taxes and other deductions."

No unfolding bracket questions are asked for alimony and other income in any wave, except for Wave 6. From Wave 2 forward, if the Respondent refuses or does not know the value of a lump sum, a follow-up question asks if the amount is more than \$50,000 (\$30,000 in Wave 2A). In Wave 1, no follow-up question is asked.

The income questions in Wave 2A are very different from other waves. Most distinctive are the "regular income" for Respondent and spouse and "other household income". After standard questions about Social Security income, SSI and food stamps, other income is asked about in a general way. If other income is present, Respondents are asked to specify the source of income. In other waves, most income types are asked specifically (e.g., Do you receive any other income?).

In Wave 2A, Financial Respondents are asked the following questions about their own income then their spouse's:

a) "Do you receive any (other) regular income payments; for example, from retirement pensions, Veterans Benefits, annuities, payments from an IRA account, or anything like that?"

b) "Please think about the largest (other) regular income you receive. What type of income is that?"

[IWER: PROBE WITH CATEGORIES ONLY IF R NEEDS HELP]

1.VETERANS BENEFITS

2.RETIREMENT OR OTHER PENSIONS

3.ANNUITY

4.IRA DISTRIBUTION

5.STOCKS AND BONDS

7.OTHER

8.DK

9.RF

This set of questions is repeated twice so that Respondents can report up to 3 current other regular incomes. Then they are asked:

a) "Did you receive any other regular income in (last calendar year) that you no longer receive?"

b) "What type of income was that?"

(Same categories as above)

So there are a total of 4 other regular incomes that can be reported. Categories may be specified more than once, and there are up to 3 different instances of "other" income.

If income is received, subsequent questions serve to identify the date of receipt (was income received in last calendar year?) and amount received. There are no unfolding brackets for income in Wave 2A.

9.No Fin resp					

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

HwITOT reflects total income for the last calendar year. HwITOT is set to the sum of Respondent and spouse earnings (RwIEARN, SwIEARN), pensions and annuities (RwIPENA, SwIPENA), SSI and Social Security Disability (RwISSDI, SwISSDI), Social Security retirement (RwISRET, SwISRET), unemployment and workers compensation (RwiUNWC, SwIUNWC), other government transfers (RwIGXFR, SwIGXFR), household capital income (HwICAP), and other income (HwIOTHR). HwIFTOT is a flag that indicates whether any components are imputed.

H2ITOT2 is derived from the Wave 2A question which asks how much total income a household received last calendar year. Missing values were imputed from unfolding bracket questions, and H2IFTOT2 flags imputed values. For HRS entry cohort Respondents, H2ITOT2 and H2IFTOT2 are set to .Q to indicate that the corresponding income information is not available in Wave 2H.

For more information about the individual variables used to calculate HwITOT, including possible differences between the HRS and AHEAD samples, please refer to the RAND HRS Detailed Imputations File Codebook, available on the [HRS website](#).

It is important to note that total household income does not include income from other household members, only the Respondent and spouse.

## Cross Wave Differences in Original HRS Data

For HRS Respondents in Wave 2H, there is no question asking for total household income. Thus, the information for H2ITOT2 and H2IFTOT2 are not available for these cases in Wave 2.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income

variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

Withdrawals from traditional IRAs or Keogh accounts are treated as income for taxation purposes. However, from an economic viewpoint, they would be considered dissaving rather than income. Therefore, we do not include them in our measure of total household income (HwITOT). Withdrawals from Roth IRAs are not taxable. The HRS survey instrument does not distinguish between traditional IRAs, Keogh accounts, and Roth IRAs. Because the former have been more common historically, we assume all withdrawals are from regular IRAs or Keogh accounts whenever the distinction matters. Even though Roth IRA ownership has increased over time, traditional IRA ownership among older households was twice that of Roth IRA ownership in 2016 (32% vs 14%).<sup>42</sup>

From Wave 5 forward, the HRS survey elicits up to three withdrawal amounts for each household, plus a fourth withdrawal amount that represents any accounts that have been cashed in. These are imputed separately, taking into account the reported frequency of withdrawals where necessary. In the case of couples, we then assign each withdrawal amount to the Respondent or the spouse. To do so, we use information about ownership of the IRA (Respondent, spouse, or both). If an IRA is owned by the Respondent, then the IRA withdrawal is assigned to the Respondent. If an IRA is owned by the spouse, then the IRA withdrawal is assigned to the spouse. IRAs are owned by individuals, so joint ownership is not possible. If the information on IRA ownership is missing, then it is assumed that the IRA belongs to the Financial Respondent, as this is the modal response observed in the data. However, the third IRA question, and the question asking about any accounts that have been cashed in, may refer to more than one IRA account (all other IRA accounts the household owns). In that case joint ownership as measured in the HRS is possible and we divided the withdrawal amount equally between both spouses.

When a Respondent does not provide a continuous amount for withdrawal from one or more IRA accounts (including cashed-in accounts), we impute those withdrawals. This is done separately by account.

For Wave 5 forward, HwIIRAW represents the total IRA withdrawal amount from all owned accounts since the last interview or in the last two years. RwIIRAW and SwIIRAW represent these same totals for the Respondent and spouse, respectively. HwIFIRAW, RwIFIRAW, and SwIFIRAW are flags that indicate whether any components are imputed, and if so, how much information is available for imputation.

To facilitate analyses that gauge the importance of IRA withdrawals compared to other economic resources, like income, which is measured for the last calendar year, we include HwIIRAWY1, RwIIRAWY1, and SwIIRAWY1 for Wave 5 forward, which prorate amounts reported in the survey instrument "since last interview" to reflect a 12-month period.

Tax laws that govern IRA withdrawals strongly influence the patterns observed in the data. For example, there are very few withdrawals prior to the age of 59 ½ because withdrawals before that age incur a tax penalty. Similarly, many households do not make withdrawals until after they turn 70 ½ when a schedule of required minimum distributions (RMD) applies. Therefore, if the withdrawn IRA amount is missing, but the Respondent indicated making an RMD, the missing value is replaced with the calculated RMD.<sup>43</sup> However, if in addition to not providing a complete set of continuous amounts, the Respondent indicates having taken the RMD, we estimate the RMD for the Respondent and impute a total withdrawal amount that is equal to the RMD if this is consistent with the Respondent's (other) answers, or the nearest amount that is consistent with the Respondent's other answers if the RMD is inconsistent with those. We then allocate the total withdrawal amount to the withdrawals from all owned accounts. We do this in such a way that the allocated amounts are always consistent with what the Respondent reported about the withdrawals from the separate accounts. The calculations and corrections based on the RMD are only performed for the measures for the last calendar year (HwIIRAWY1, RwIIRAWY1, and SwIIRAWY1). We have not attempted to calculate a pseudo-RMD for the period since the last interview.

For further details about how the IRA withdrawal variables were derived for Wave 5 forward, see Hurd, Meijer, Pantoja, and

<sup>42</sup>ICI Research Perspective, January 2017, Vol. 23, No. 10A, <https://www.ici.org/pdf/per23-10a.pdf>

<sup>43</sup>The Coronavirus, Aid, Relief and Economic Security (CARES) Act waived RMDs for tax year 2020. We therefore ignore the RMD for those interviewed in 2021.

Rohwedder (2018).<sup>44</sup>

In Wave 2A, the survey contains a series of questions for both the Respondent and spouse that ask about "regular income payments," of which "IRA distributions" is one of several response options. While it is possible to report as many as four IRA distributions, only two are actually present in the data for both the Respondent and spouse. These are imputed separately, just as we do for the other regular income payments asked about in this question sequence. R2IIRAWY1 and S2IIRAWY1 represent the total IRA distribution amount from all owned accounts in the last calendar year. R2IFIRAWY1 and S2IFIRAWY1 are flags that indicate whether any components are imputed, and if so, how much information is available for imputation. For the convenience of the analyst, we also provide the household-level variables H2IIRAWY1 and H2IFIRAWY1, which combine the information in the corresponding Respondent and spouse variables.

### Cross Wave Differences in Original HRS Data

From Wave 5 forward, the HRS survey elicits information on whether households own any individual retirement accounts and asks related follow-up questions in the Assets and Income section of the survey. In married or partnered households the Financial Respondent answers all questions in this section on behalf of both the Respondent and the spouse. The IRA questions follow the same basic structure:

a) "Do you (or your husband/wife/partner) currently have any money or assets that are held in an Individual Retirement Account, that is, in an IRA or KEOGH account?"

b) "How many IRA or KEOGH accounts do you (and your husband/wife/partner) have?"

The following sequence is then asked up to three times, depending on how many IRA or Keogh accounts were reported. Respondents are first asked about the largest, followed by the next largest, and the third or – if the household owns more than three – all other IRA or Keogh accounts, if applicable.

c) "Are these / Is that yours or your (husband's/wife's/partner's)?"

d) "About how much (in total) is in this (these (other) IRA or KEOGH) account(s) at the present time?"

If the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. Later, Respondents are asked about IRA withdrawals:

a) "Have you (or your (husband/wife/partner)) withdrawn any money or received any payments from (this account/these accounts) (since R's last interview / in the last two years)?"

b) "Altogether, about how much money did you (or your (husband/wife/partner)) withdraw from (this account/these accounts) (since R's last interview / in the last two years), (before taxes and other deductions)?"

Again, if the Respondent refuses or does not know the value, a series of unfolding bracket questions are asked. Those who provide a continuous value are asked about the frequency of receipt, with the following recorded response options:

1. IN TOTAL
3. MONTH
4. QUARTER
5. 6 MONTH
6. YEAR
7. OTHER (SPECIFY)
8. DK (Dont Know); NA (Not Ascertained)
9. RF (Refused)

For those who answer the unfolding bracket questions, the frequency of receipt question is not asked, and the bracket questions

<sup>44</sup>Hurd, M. D., Meijer, E., Pantoja, P., and Rohwedder, S. (2018). Addition to the RAND HRS Longitudinal Files: IRA Withdrawals in the HRS, 2000 to 2014. Working Paper No. 2018-388. Ann Arbor, MI: Michigan Retirement Research Center. <http://doi.org/10.2139/ssrn.3337842>

refer to the total period (since last interview or last two years).

Finally, Respondents are asked the following question:

c) "Did you (or your (husband/wife/partner)) take out only the "minimum withdrawal option," that is, the amount required to avoid a tax penalty?"

Respondents are then asked a separate set of questions about any IRA or Keogh accounts that have been cashed in or annuitized. First, they are asked:

a) "Did you (or your (husband/wife/partner)) cash in or convert any (other) IRA or KEOGH accounts to annuities at any time (since FINANCIAL R's LAST IW MONTH, YEAR/in the last two years)?"

Those who say "yes" are asked:

b) "Was that your IRA or KEOGH or your (husband's/wife's/partner's)?"

c) "Did you (or your (husband/wife/partner)) cash in these accounts, convert them to annuities, or what?"

Respondents who report cashing in any accounts are asked how much was withdrawn. If they refuse or do not know the value, a series of unfolding bracket questions are asked, except in Wave 5, where no such questions are present.

The information elicited in the survey allows computing for each household the total IRA withdrawal amount taken out since the last interview, or in the last two years.

In Wave 2A, Financial Respondents are asked the following questions about their own income and then are asked about their spouse's income:

a) "Do you receive any (other) regular income payments; for example, from retirement pensions, Veterans Benefits, annuities, payments from an IRA account, or anything like that?"

b) "Please think about the largest (other) regular income you receive. What type of income is that?"

3. ANNUITY
4. IRA DISTRIBUTION
5. STOCKS AND BONDS
7. OTHER
8. DK
9. RF

This set of questions is repeated twice so that Respondents can report up to 3 current other regular incomes. Then they are asked:

a) "Did you receive any other regular income in (last calendar year) that you no longer receive?"

b) "What type of income was that?"

(Same categories as above)

So there are a total of 4 other regular incomes that can be reported. Categories may be specified more than once, and there are up to 3 different instances of an income like pensions or stocks. Besides pensions and annuities, other waves allow only one reported

amount for most income categories, so that a Respondent would give a total of all dividend income received.

If income is received, subsequent questions serve to identify the date of receipt (was income received in last calendar year?) and amount received. There are no unfolding brackets for income in Wave 2A.

## General Comments

Income measures are reported in nominal dollars. When an HRS or AHEAD income component is missing, it is imputed using the method described in the section titled "Income and Wealth Imputations" earlier in this document. Unless otherwise noted, income variables refer to income received last calendar year.

The HRS and AHEAD income components are summed to create the income measures found here in the RAND HRS Longitudinal File. For each derived income measure, a flag indicates whether any or all of its components were imputed. Individual income components and imputation flags are available in the RAND HRS Detailed Imputations File.

## How Constructed

The household income from the last calendar year is compared to the U.S. Census Bureau poverty thresholds for the year prior to the interview wave. For example, for Wave 6 (HRS 2002), it is compared to poverty thresholds from 2001 and for Wave 7 (HRS 2004), it is compared to poverty thresholds from 2003. The family composition is derived using household members reported at the time of the interview.

HwINPOV indicates whether household income for the last calendar year is below the poverty threshold, using the U.S. Census Bureau definition and poverty thresholds. There are separate income levels for 48 categories of family composition. The number of resident family members, the number under 18 years old, and the age of the household head define family composition. HwPOVFAM provides the family composition used to determine the appropriate income level. HwPOVTHR stores the corresponding Census Bureau poverty threshold for the appropriate year. HwPOVHHI provides the household income that is to be compared to the poverty threshold. HRS total household income (HwITOT) is adjusted to conform to the Census Bureau definition, that is, food stamps are subtracted, and amounts previously deducted from Social Security payments for Medicare Part B and/or Part D premiums, and income of other resident family members are added. HwINPOVR is the ratio of household income to the poverty threshold (i.e.,  $HwINPOVR = HwPOVHHI/HwPOVTHR$ ).

The Census Bureau (CPS-compatible) definition of resident family includes those away with no other residence who are not institutionalized. For compatibility, non-core resident family members who are away in institutions (i.e., those who are in the military or institutions like nursing homes or prisons) are not counted, and core HRS Respondents who reside in nursing homes are excluded. If the HRS Respondent lives in a nursing home at the time of the interview then HwINPOV, HwPOVFAM, HwPOVTHR, HwPOVHHI, and HwINPOVR are all set to a special missing value (.I) to indicate that the Census Bureau definition of poverty does not apply. If one person in a couple lives in a nursing home, they are not counted in determining the family composition, and their income is subtracted

from the total household income. HwNHMLIV summarizes the nursing home residence status of the core HRS household. It is based on RwNHMLIV and SwNHMLIV, documented in the Health section.

HwPOVHHI =

- (total household income - food stamps)
- + (Medicare Part B and/or Part D premiums for cases where these had been deducted from Social Security payments)
- + (income of non-core resident family members)
- (income of any core HRS nursing home resident, including earnings, pensions and annuities, SSI, Social Security, unemployment and workers compensation, government transfer income, household capital income, and all other household income, as well as Medicare Part B and/or Part D premiums for cases where these had been deducted from Social Security payments).

Beginning in Wave 8, individuals are asked if they are enrolled in Medicare Part D. In Waves 9 and 10, individuals are also asked how they pay their premiums. One option for payment of premiums is an automatic deduction from Social Security benefits. Those who report having premiums deducted from their benefits are asked the amount of their monthly deduction. We provide a separate set of poverty variables that take into account this additional information about Medicare Part D premiums in Waves 9 and 10. These include HwINPOVD, HwINPOVRD, and HwPOVHHID.

To address outlying values, we first winsorize the reported Part D premium amounts at the 95<sup>th</sup> percentile, resulting in a maximum monthly deduction of \$132 and \$170 for Waves 9 and 10, respectively. Of those reporting an automatic deduction, there are some Respondents who do not report a dollar amount, and for these we impute the monthly deduction using the median deduction (\$35 per month and \$48 per month for Waves 9 and 10, respectively) among Respondents with a positive deduction amount. There is also a small percentage of Respondents who report \$0 for the amount deducted, and for these we (a) leave the amount deducted at \$0, and (b) include them in the pool of Respondents used to determine the median deduction for the imputation.

For details about the poverty variables included in this file, please see the section titled "Poverty Threshold Definitions and HRS Measures" earlier in this document.

### Cross Wave Differences in Original HRS Data

From Wave 3 forward, questions in the Assets and Income section of the survey ask whether each household resident 16 years of age or older works, and if so, how much income was earned in the last calendar year:

During ([LCY]<sup>45</sup>), did ([Person Name]) do any work for pay?

About how much money did ([Person Name]) earn from all jobs in ([LCY]), before taxes and other deductions?

There is also a question about total non-job income of all resident family members:

Not including job income, about how much in total did other members of your family living (here/there) receive in ([LCY]) from Social Security, pensions, welfare, interest, gifts, or anything else, (before taxes and other deductions)?

Both questions collect a continuous value and, if missing, unfolding bracket values. In Wave 3, the qualifier "before taxes and other deductions" is not present.

In Waves 1 and 2H, the questions about earned income and total non-job income are similar to those for Wave 3 forward, and like Wave 3, the qualifier "before taxes and other deductions" is not present. In Wave 1, unfolding bracket questions are not asked. However, the question about whether the household member did any work for pay is different:

During ([LCY]), did ([Person Name]) have a full-time or part-time job—not counting work around the house? (Was that full or part-time?)

In Wave 2A, the questions about earned income and total non-job income are slightly different than those in other waves:

Is ([Person Name]) working 30 hours or more per week, under 30 hours, or not at all?

<sup>45</sup>"LCY" is last calendar year relative to the interview year.

About how much money did ([Person Name]) earn from all (his/her) jobs in (1992/1993)? PER<sup>46</sup>

2.WEEK

3.MONTH

4.QUARTER

5.6 MONTHS

6.YEAR

7.OTHER (SPECIFY)

About how much total income did others in your household receive in (1992/1993) from Social Security, pensions, welfare, interest, gifts, jobs<sup>47</sup>, or anything else? Do not include your own (and your (husband's/wife's/partner's)) income in this answer.

<sup>46</sup>We use the "per" question to convert the reported amounts to LCY, since this is the time period reflected in the unfolding bracket questions.

<sup>47</sup>In all other waves, "jobs" is not specified in the question text. The fact that it is mentioned here suggests that job income could be double-reported. We will examine this issue in a future version.

---

SASSRECV: Any Spouse Receives SocSec

---

Value		
.U=Unmarried		10748
0.No		11311
1.Yes		20346

### How Constructed

RASSRECV is derived by looking at all waves of data. If the Respondent receives Social Security (OASDI) at any wave, RASSRECV is set to "yes" (=1).

SASSRECV is derived by looking at all waves of data. If any of the Respondent's spouses receives Social Security at any wave, SASSRECV is set to "yes" (=1). If the Respondent is not in a couple household in any wave and never reports a spouse receiving Social Security, SASSRECV is set to SAS special missing value .U for unmarried.

Social Security income measures are reported at the household level at all waves. The Financial Respondent reports income for both themselves and their spouse or partner. Through Wave 5, Social Security income is taken from a variable in the Assets and Income section that identifies who receives this type of income: Financial Respondent only, Financial Respondent's spouse only, or both. If both the Financial Respondent and the Financial Respondent's spouse receive Social Security income, then both RASSRECV and

SASSRECV are set to yes. If the Respondent is the Financial Respondent, then a response indicating "Financial Respondent only" sets RASSRECV to yes and a response indicating "Financial Respondent's spouse only" sets SASSRECV to yes. If the Respondent is the Financial Respondent's spouse, then a response indicating "Financial Respondent only" sets SASSRECV to yes, and a response indicating "Financial Respondent's spouse only" sets RASSRECV to yes.

From Wave 6 onward, all Respondents are asked whether they receive Social Security in the Employment section. In addition, the Financial Respondent is asked if their spouse receives Social Security income in the Assets and Income section. To derive SASSRECV, the self-report of the Financial Respondent's spouse is used first, but if it is missing, or if the spouse did not respond, the Financial Respondent's report from the Assets and Income section is used.

### Cross Wave Differences in Original HRS Data

The Financial Respondent (FinR) answers all questions in the Assets and Income section for the entire household. Through Wave 5, the Financial Respondent is asked if anyone in the household receives Social Security income, and if so, who (Financial Respondent only, Financial Respondent's spouse only, or both).

In Wave 1 and 2A, the raw data provide one variable that combines the answers to these two questions. In Wave 3A, the question is asked separately for the Financial Respondent and spouse. In Waves 2H, 3H, 4, and 5, there are two variables to capture this information.

From Wave 6 onward, all Respondents are asked in the Employment section whether they receive Social Security income. In the Assets and Income section, the Financial Respondent's response is carried from the Employment section, and the Financial Respondent is then asked if the spouse receives any Social Security income. There are thus two possible sources for whether the spouse of the Financial Respondent receives Social Security income: the spouse's own response in the Employment section and the Financial Respondent's report in the Assets and Income section.

RASSAGEB	20152	60.53	7.12	0.1	92.7
SASSAGEB	13380	61.31	6.22	0.1	90.1

### How Constructed

RASSAGEB is the age in years and RASSAGEM is the age in months when the Respondent starts to receive Social Security (OASDI) income.

SASSAGEB is the age in years and SASSAGEM is the age in months when the Respondent's spouse or partner starts to receive Social Security income. If the Respondent has more than one spouse, then we look at the first time any spouse is reported to receive Social Security income. SASSAGEB is derived as the age of this spouse at the starting month given at that interview.

If the Respondent is not in a couple household in any wave, and never reports a spouse receiving Social Security income, SASSAGEB and SASSAGEM are both set to SAS special missing value .U for unmarried.

The month the Respondent or spouse starts to receive Social Security income is taken from the first interview at which they are reported to receive it. The Respondent or spouse's age is derived from this month and the appropriate birth date. The age in months is first calculated, and the age in years is calculated as the age in months divided by 12 and rounded to 1 decimal place.

If the year when Social Security is first received is given but the month is missing, then the month used to calculate age is the month after the individual's birthday, except for those born in December, in which case December is used.

In Waves 2A and 3A, there is no specific month or year recorded if the Respondent or their spouse first received Social Security more than two years prior. Further, there are cases where the two-year question is also skipped. For these cases, if a start month is given at a later wave and provides a date that precedes the W2A interview or the two years prior if the Respondent started receiving more than two years previously, then the given start month is used in deriving this variable. Otherwise, the start month and year for cases where receipt began more than two years before are set to .T. For cases where the two-year question is missing, the start month and year are set to .M.

If the Respondent has not yet started to receive Social Security income, then RASSAGEM and RASSAGEB are both set to

.S.

Social Security income measures are reported by the Financial Respondent for the household in all waves. The Financial Respondent reports the month Social Security income starts for both themselves and their spouse or partner. The month when the Respondent starts receiving Social Security is that of the Financial Respondent, and the month when the spouse started is that of the Financial Respondent's spouse. If the Respondent is the spouse of the Financial Respondent, then the Financial Respondent-reported Respondent and spouse measures are swapped. That is, if the Respondent is the Financial Respondent's spouse, then the Financial Respondent-reported spouse start month is assigned as the Respondent's start month.

### Cross Wave Differences in Original HRS Data

The Financial Respondent (FinR) answers all income questions for the household. If the Financial Respondent or the Financial Respondent's spouse or partner receives Social Security income, then a question asks when it began for each individual.

In Waves 1 and 2H, the month when Social Security income was first received is asked for everyone who receives it. In Waves 2A and 3A, if the Respondent or their spouse started to receive Social Security more than two years ago, the questions pertaining to month and year started are skipped. Note that, since most people in the AHEAD cohort are age 70 or older at Wave 2A, the majority began receiving Social Security more than two years prior to the interview, and thus are not asked the month when it began. Furthermore, for unknown reasons in Wave 2A, the majority of cases skip the question about whether the Financial Respondent's Social Security started more than two years ago and hence also skip the question on the specific starting date. The two-year question for Financial Respondent's spouse does not appear to have this skip problem.

In Wave 3H, the month Social Security income was first received is not asked if a preloaded variable indicates that the individual reported receiving Social Security at a previous wave. If the preload indicates no report of receiving Social Security income at a previous wave, then the year when it started is asked. If the year is 1994 or later, then the month is asked. If the year is before 1994, then the month is not asked. From Wave 4 forward, the questions are structured the same as in Wave 3H, except the year cut-offs for asking month are two years prior, e.g., 1996 in Wave 4, 1998 in Wave 5, and 2000 in Wave 6.

## How Constructed

RwSSAPP, RwSSDEN, RwSSAPL, RwSSREC, and RwSSSTP indicate if the Respondent has applied, been denied, appealed, started to receive, or stopped receiving Social Security Disability Income (SSDI) or Supplemental Security Income (SSI) benefits since last wave. RwSS[stat]Y and RwSS[stat]M provide the year and month the Respondent applied, appealed, started to receive, or stopped receiving SSDI or SSI benefits since last wave. These variables are available in Waves 2H, 3H, and 4 because changes in SSDI and SSI status are asked together for these waves.

RwSDIAPP, RwSDIDEN, RwSDIAPL, RwSDIREC, and RwSDISTP indicate if the Respondent has applied, been denied, appealed, started to receive, or stopped receiving Social Security Disability Income (SSDI) benefits since last wave. RwSDI[stat]Y and RwSDI[stat]M provide the year and month the Respondent applied, appealed, started to receive, or stopped receiving SSDI benefits since last wave. RwSSIAPP, RwSSIDEN, RwSSIAPL, RwSSIREC, and RwSSISTP indicate if the Respondent has applied, been denied, appealed, started to receive, or stopped receiving Supplemental Security Income (SSI) benefits since last wave. RwSSI[stat]Y and RwSSI[stat]M provide the year and month the Respondent applied, appealed, started to receive, or stopped receiving SSI benefits since last wave. These variables are available Waves 5 forward because changes in SSDI and SSI status are asked separately for these waves.

In Waves 2H, 3H, and 4 forward, Respondents are first asked, "Do you have any impairment or health problem that limits the kind or amount of paid work you can do?"

In Waves 2H, 3H, and 5 forward if a Respondent says no, "too old to work," or don't know/refuse, then the questions about change in SSDI and SSI status are not asked and all of the indicator variables are set to .N=not disabled, .A=too old, or .S=skip respectively. In Wave 4, most Respondents are asked the status questions regardless of their response to this question.

In Waves 2H, 3H, 4, and 5, if a Respondent is newly disabled and interviewed by proxy, then the questions about change in

SSDI and SSI application status are not asked and all of the indicator variables are set to .S=Skip.

If a preload indicates that a Respondent was receiving SSDI or SSI benefits last wave, they are asked if they are still receiving that benefit.

From Wave 5 forward, if a preload indicates that a Respondent's application for SSDI or SSI benefits was pending last wave, they are asked if they were approved or denied. If denied, they are asked if they appealed the denial. If approved, they are asked if they are still receiving the benefit.

Finally, in Waves 2H, 3H, 4, and 5 forward, Respondents are asked "Since [last interview] have you applied for disability benefits from any (other) government program?" with SSDI and SSI programs indicated as a possible answer. If the Respondent applied to SSDI or SSI since last wave, they are asked if they were approved or denied. If denied, they are asked if they appealed the denial. If approved, they are asked if they are still receiving the benefit.

If a Respondent indicates that they have applied, appealed, started receiving, or stopped receiving SSDI or SSI benefits, the year and month of the status change is asked. If the relevant indicator variable is not 1, .C=SSDI converted to SS, or .P=Date listed before previous IW, then the date variables are set to .S=skip because the date variables were not asked. In cases when the relevant year given is more than two years ago, the month is not asked and is set to .S=Skip. The year and month of a denial is not asked.

When the date applied is asked, Respondents can give a response of "not applied since last wave." In these cases, RwSSAPP, RwSDIAPP, or RwSSIAPP is set to 0 and the respective date variables are set to .S=Skip.

If a Respondent provides a date prior to their last interview, then the relevant indicator variable is set to .P= Date listed before previous IW, but the year and month are still captured in the respective date variables.

In Waves 2H, 3H, and 4, if a Respondent does not know the date they applied for SSDI or SSI benefits, then the Respondent is not asked any follow-up questions and RwSSDEN, RwSSAPL, RwSSREC, and RwSSSTP set to .S=Skip.

For new Respondents in a wave, all the variables are set to .T=New IW/Asked as such, since these variables capture change since a previous wave. Wave 4 is the first time that Respondents in the AHEAD Cohort (HACOHORT=1) are asked these questions so most are treated as first-time Respondents and have all of the wave-specific variables set to .T New IW/Asked as such.

From Wave 5 forward, RwSDISTP is set to .C=SSDI converted to SS when the Respondent is at or above normal retirement age and was receiving SSDI but did not indicate they stopped receiving it this wave or if the Respondent indicated that "SSDI has converted to Social Security" when asked if they were still receiving SSDI.

The corresponding Sw[VAR] variables provide this information for the Respondent's spouse or partner.

Note that these variables capture *changes* in the SSDI and SSI Status. For general status information, please refer to RwdSTAT, documented in the section titled "SSDI, SSI Status (Each Wave)".

### **Cross Wave Differences in Original HRS Data**

Since these variables capture changes in status since last wave, there are no Wave 1 variables.

In Wave 2A and 3A, there are no comparable questions, and so for members of the AHEAD cohort, all of the wave-specific variables in this section are set to .Q to indicate that no information is available.

In Waves 2H, 3H, and 4, changes in SSDI and SSI status are asked together.

In Waves 2H, 3H, and 4, if a Respondent's application for SSDI or SSI benefits was pending last wave, there are no follow-up questions. i.e., they are not asked if they were approved or denied, if they appealed, or if they are still receiving the benefit. Therefore, this information is not available to be included into the relevant variables for these waves.

In Wave 3H, RvSSSTP is set to .C=SSDI conv to SS if the Respondent indicated that "SSDI has converted to Social Security" when asked if they were still receiving SSDI or SSI benefits.

From Wave 5 forward, changes in SSDI and SSI status are asked separately.

In Wave 5 only, if a Respondent is newly disabled and interviewed by proxy, then the questions about change in SSDI and SSI application status are not asked and all of the indicator variables are set to .S=Skip.

From Wave 5 forward, RvSDISTP is set to .C=SSDI conv to SS when the Respondent is at or above normal retirement age and were receiving SSDI but did not indicate they stopped receiving it this wave or if the Respondent indicated that "SSDI has converted to Social Security" when asked if they were still receiving SSDI. In most waves (from Wave 5 forward), Respondents are not asked the month and year their SSDI stopped in these cases so RvSDISTPY and RvSDISTPM are set to .S=Skip. In Wave 8, however, many Respondents who indicated that "SSDI has converted to Social Security" were asked these questions and their responses are recorded in RvSDISTPY and RvSDISTPM.

## How Constructed

These variables present information about multiple Social Security Disability Insurance (SSDI) and Supplemental Security Income (SSI) disability applications and receipt from all waves of data. A person may apply for SSDI or SSI (or both) multiple times. Each application process is considered a new episode. RADNEPI counts the total number of disability episodes. The other episode variables have suffixes indicating to which episode the information applies. For example, RADSTAT2 gives the status of episode two or the second application seen in the data, and RADAPPY2 gives the year that application was made.

RADTYPE $n$  indicates whether episode " $n$ " involves SSDI or SSI. If the program type is ambiguous, RADTYPE $n$  is given a value of 3, "SSDI and/or SSI-DK which." In these cases, it may be that the episode involves either or both programs. Before Wave 5, questions about SSDI and SSI are combined. From Wave 5 forward, the programs are treated separately. If an episode is active at Wave 5 or beyond, the type of application may be determined. However, after Wave 5, there may be inconsistencies in the program from which the Respondent receives benefits. For instance, the Respondent may report receiving benefits from SSDI in Wave 5, then in Wave 6 report that they continue to receive benefits, but from SSI. In these cases, RADTYPE $n$  is set to indicate the ambiguity.

RADSTAT $n$  indicates the status of episode " $n$ ," and expected statuses are: applied, re-applied or appealed, not awarded, receiving, and stopped receiving. Normally, the status of an episode will be receiving, stopped receiving, or not awarded. If the status is applied or re-applied/appealed, the Respondent has not yet reported whether the benefits will be awarded. An episode is considered active if the status is any status except "stopped receiving."

Because of the ambiguity of the question in early waves, a status of "not awarded" does not necessarily mean that the application has been rejected. Information in subsequent waves may inform this status. If a Respondent denies receiving benefits in the current wave and had not reported receiving benefits in the previous wave, we assume the application was rejected (RADSTAT $n$ =7). Similarly if the Respondent states they do not receive benefits but had not previously reported being awarded them, it is assumed that the application was rejected, but with a different status, as there is the possibility benefits were received for a short time (RADSTAT $n$ =61, 62, 66). If a Respondent denies receiving benefits, and had previously reported that benefits had stopped, the denial confirms the prior situation and the status remains as is. However, if the stop is reported without having ever reported receiving, it is assumed that the application was rejected, i.e., that benefits were never received.

In some cases an episode is unresolved, e.g., there is an active episode, but the thread is dropped. That is, either no information about whether the Respondent is still receiving benefits is given and a new application is begun, or a Respondent indicates having active episodes for both programs, but at the next wave indicates only one. These episodes are given an illogical ending status that indicates what the status was when the thread was dropped (RADSTAT $n$ =91, 92, 94).

In some cases it is possible that the appropriate follow-up questions at the next interview are not asked, and the episode is thus left somewhat in limbo. These episodes may appear as still active since no further activity is observed. In particular, it is likely that most episodes with a "not awarded" status are rejected applications.

Dates of application, appeal or re-application, receipt, and end of benefits are provided as month and year, and as SAS dates. The month and year variables are set to the values as reported in the raw data, with missing codes recoded to SAS special missings (.D, .R, .M). The SAS date reflects the given month, if not missing, but is logically imputed if the month or year is missing. As the data are processed, lower and upper bounds for the period when an event may have occurred are kept. For example, if the receive month is missing, but an application month is not, the lower bound would be the application month and the upper bound the interview date. The SAS date is the midpoint between the lower and upper bounds.

In some cases the specific months given indicate an illogical order of events, e.g., an application after the benefits begin. We do not attempt to "correct" these illogical sequences.

RADAPPM<sub>n</sub> and RADAPPY<sub>n</sub> are the month and year of application for episode "n." RADAPPD<sub>n</sub> is the imputed SAS date for the application. RADREAM<sub>n</sub> and RADREAY<sub>n</sub> are the month and year of appeal or re-application for episode "n." RADREAD<sub>n</sub> is the imputed SAS date for the appeal or re-application. RADRECM<sub>n</sub> and RADRECY<sub>n</sub> are the month and year when benefits begin for episode "n." RADRECD<sub>n</sub> is the imputed SAS date for first receipt of benefits. RADENDM<sub>n</sub> and RADENDY<sub>n</sub> are the month and year when benefits stop for episode "n." RADENDD<sub>n</sub> is the imputed SAS date for when benefits stop.

Spouse variables are not included. There are many variables, and data are rarely populated for both members of a household. We also do not include the lower and upper bound variables. If you have a need for spouse versions of these variables, or for the lower and upper bound dates, please contact us.

See the introduction section "Social Security and SSI Disability Episodes" for further descriptions of how these variables are derived.

### **Cross Wave Differences in Original HRS Data**

The Disability section of the HRS asks questions about whether the Respondent has applied for disability benefits from Social Security Disability Insurance (SSDI) or Supplemental Security Income (SSI) in every wave. Before Wave 5, the questions ask about the two programs together. From Wave 5 forward, the questions ask about the programs separately.

The general sequence of questions asks whether the Respondent has applied for SSDI/SSI, and if so, when they first applied and whether the application was approved. If the application was not approved, questions ask if the Respondent appealed or re-applied, and if so, when and whether this was approved. If either the initial or re-application was approved, questions ask when the Respondent started receiving benefits, whether they are still receiving benefits, and if not, when the benefits stopped. Dates are collected as month and year. There are variations on this sequence over time, and the sequence can occur across interviews. For example, a Respondent could apply between Waves 2 and 3, be approved and begin receiving benefits between Waves 3 and 4, and stop receiving benefits between Waves 5 and 6.

In Waves 2A and 3A, questions about disability benefits were not asked due to the older ages of the AHEAD entry cohort. In other waves, there are variations on the general sequence of questions.

In Wave 1, the question asks if the Respondent has ever applied for SSDI or SSI. In Waves 2H, 3H and 4, it asks if the Respondent has applied for disability benefits from any government program since the last interview (or ever if it is the first interview) and if yes, asks which programs with SSDI and SSI presented as one choice. In Wave 5, the wording is the same but applications to SSDI and SSI are separate choices. Beginning in Wave 6, SSDI and SSI are presented as one choice but if indicated, a follow-up question asks which program. From Wave 5 forward, a Respondent may report applying to one or the other or both.

If the Respondent applied, the first month of application is asked. From Wave 2 forward, if that month is before the prior interview, the Respondent is asked for the first month of application since the last interview. If no application was made since the last interview, the rest of the sequence of questions is skipped.

If the Respondent has applied or re-applied for SSDI/SSI, a question asks about the status of the application. In Waves 1, 2, and 3H, the wording of this question is, "Were you awarded benefits then?" From Wave 4 forward, the wording is more specific for new applications: "Was your application accepted, rejected, or is it still being considered?" For those who had applied in a prior wave but had not heard, the question first states that according to the records, the Respondent had applied. It then asks, "Was your [SSDI/SSI] application approved?"

Those who apply for SSDI/SSI at one wave and are still receiving benefits can be asked questions at the subsequent interview. In Waves 2H and 3H, it appears that everyone who applied for SSDI/SSI at the previous interview is asked if they are still receiving benefits, whether or not they were awarded at that earlier time. From Wave 4 forward, questions on whether the Respondent is still receiving benefits are asked only of those who have a preload value indicating that they were receiving benefits at the previous interview. From Wave 3H forward, the Respondent may deny receiving benefits at the previous interview.

From Wave 5 forward, if preload values indicate that the Respondent was receiving benefits at the prior interview, the type of program is collected, and then questions ask if the Respondent is still receiving benefits. In Wave 5 only, the month first received is also collected regardless of whether the Respondent is still receiving benefits or not. Beginning in Wave 7, the type of program also includes SSDI benefits that have converted to Social Security, and the survey asks the month and year the SSDI benefits stopped.

Beginning in Wave 3H, someone who applies for SSDI/SSI may indicate that they had not yet heard whether benefits will be awarded. Beginning in Wave 4 for those with a preload indicating this situation, questions are included which ask whether the pending application was approved. However, in Wave 4, these questions were inadvertently skipped for all cases. From Wave 5 forward, the Respondent is first asked which program, SSDI or SSI, and then is asked about each program separately. The question sequence asks if the application was approved and then continues in the usual way.

Note that someone continuing to receive benefits may also report a new application.

## How Constructed

RwDSTAT indicates whether a Respondent is receiving or applying for disability benefits through Social Security Disability Insurance (SSDI) and/or Supplemental Security Income (SSI) at Wave "w." It is a three-digit variable, where the ones-digit indicates the status of SSI, the tens-digit indicates the status of SSDI, and the hundreds-digit indicates the status of SSDI/SSI where we do not know which program. A one in the appropriate digit indicates that the Respondent has applied but has not been awarded or rejected. A two indicates that the Respondent is receiving benefits, and a zero indicates neither applying nor receiving. For example, 12 means that the Respondent is applying for SSDI and receiving SSI benefits, and 100 indicates the Respondent is applying for SSDI or SSI or both, but we do not know which program.

Before Wave 5, SSDI and SSI are combined in the survey questions. From Wave 5 forward, these programs are treated separately. If the Respondent first reports an application, reapplication, or receipt for SSDI or SSI before Wave 5, we do not know which program is involved. If the receipt or application remains active until Wave 5 or beyond, the Respondent is asked which program, and the statuses for SSDI and SSI can be reported distinctly. In some cases a Respondent reports receiving (or applying for) benefits from SSDI in Wave 5 and reports still receiving benefits at Wave 6, but then reports that the benefits are from SSI or vice versa. In these cases, status is reported for the program type reported in the current wave. For example, if the Wave 5 program is SSDI and the Wave 6 program is SSI, then the Wave 5 status is reported for SSDI, and then in Wave 6, for SSI.

SwDSTAT indicates whether the Respondent's spouse is receiving or applying for SSDI or SSI at Wave "w." It is taken from the spouse's self-reported RwDSTAT for Wave "w."

In Wave 2A and 3A, there are no comparable questions, and so for members of the AHEAD cohort, R2DSTAT and R3DSTAT

are set to .Q to indicate that no information is available.

For more detailed information on disability applications and benefit receipt, please see the "SSDI/SSI Disability Episodes" variables.

### Cross Wave Differences in Original HRS Data

The Disability section of the HRS asks questions about whether the Respondent has applied for disability benefits from Social Security Disability Insurance (SSDI) or Supplemental Security Income (SSI) in every wave. Before Wave 5, the questions ask about the two programs together. From Wave 5 forward, the questions ask about the programs separately.

In Wave 1, a question asks if the Respondent has ever applied for SSDI or SSI, and if yes, whether they are currently receiving benefits. If not, another question asks whether they have appealed or re-applied and if so, whether the re-application was approved.

In Waves 2H, 3H and 4, it asks if the Respondent has applied for disability benefits from any government program since the last interview (or ever if it is the first interview) and if yes, asks which program(s). In the answers, SSDI and SSI are listed together. If the Respondent reports applying for SSDI/SSI, then the questions follow the same pattern as in Wave 1.

From Wave 5 forward, the question wording is the same but separate questions are asked for the two programs. If the Respondent reports applying for but not receiving SSDI benefits, a question then asks whether they have appealed or re-applied for SSDI, and if so, when the last re-application was made. If an SSI application without approval is reported, then another question asks if they have appealed or re-applied for SSI and if so, when the last re-application was made.

After Wave 1, re-interviewed Respondents are asked questions about the status of previously reported SSDI/SSI benefit receipt. From Wave 4 forward, re-interviewed Respondents are asked about the status of applications made but unresolved at the prior wave. If a Respondent had applied for SSDI/SSI in a previous wave and the application was still pending, they are asked if it was approved. From Wave 5 forward, they are first asked what type of benefit was applied for or received, SSDI or SSI. From Wave 5 forward, if the prior wave application was not approved, the Respondent is asked if they have appealed or reapplied. These questions are asked before the questions about applying since last interview described above.

In Wave 2A and 3A, there are no comparable questions.

## How Constructed

RwSSDI indicates whether a Respondent is receiving benefits from Social Security Disability Insurance (SSDI) at Wave "w." It is derived from RwDSTAT (SSDI, SSI Status, from Disability section) and RwIOSDI (Receives SSDI, See the RAND HRS Detailed Imputations File Codebook, available on the [HRS website](#)).

RwSSDI is set to yes (=1) if RwDSTAT equals "20.Receiving SSDI", "21.Receiving SSDI/Applying SSI", or "22.Receiving SSDI and SSI." We do not assign RwSSDI to be yes if we cannot determine which program is involved. For more information, please refer to the documentation for RwDSTAT.

RwSSDI is also set to yes (=1) if RwIOSDI is "1.Receives Income from SSDI." This variable does include imputed values. The imputation flag RwIFSDDI indicates whether the component is imputed, and if so, how much information is available for imputation. For more information about RwIOSDI and RwIFSDDI, please refer to the RAND HRS Detailed Imputations File Codebook, available on the [HRS website](#).

SwSSDI indicates whether the Respondent's spouse is receiving benefits from SSDI at Wave "w." It is taken from the spouse's self-reported RwSSDI for Wave "w."

For more detailed information on disability applications and benefit receipt, please see the "SSDI/SSI Disability Episodes" variables.

### **Cross Wave Differences in Original HRS Data**

The Disability section of the HRS asks questions about whether the Respondent has applied for disability benefits from Social Security Disability Insurance (SSDI) or Supplemental Security Income (SSI) in every wave. Before Wave 5, the questions ask about the two programs together. From Wave 5 forward, the questions ask about the programs separately. If we cannot determine which disability program is involved, RwSSDI is not set to yes.

The Assets and Income section of the HRS also asks questions about whether the Respondent has applied for SSDI in every wave. Receipt of benefits in the Assets and Income section are based on the last calendar year, unlike the Disability section, where benefits are reported from the Respondent's last interview.

## How Constructed

RwDSSAMT is the amount a Respondent reports receiving from Social Security Disability Insurance (SSDI) at Wave "w." RwDSIAMT is the amount a Respondent reports receiving from Supplemental Security Income (SSI) disability at Wave "w." These variables are available beginning in Wave 5. They are simply taken from the amounts reported in the raw data and recoded for missing values. Please note a respondent reports a value for R10DSIAMT of 9996. While this is close in proximity to raw variable special missing values of 9998 and 9999, 9996 is a possible valid value and has been verified by HRS.

A Respondent may be receiving benefits from either program or both. A separate variable RwDSTAT indicates whether a Respondent is receiving benefits at Wave "w." Please see "SSDI/SSI Status" for information on the RwDSTAT variables. If benefits ended between the current and prior interview, the amount reported is for the last month when benefits were received.

SwDSSAMT and SwDSIAMT are the amounts the Respondent's spouse is receiving from, respectively, SSDI and SSI, at Wave "w." It is taken from the spouse's self-reported RwDSSAMT and RwDSIAMT for Wave "w."

For more detailed information on disability applications and benefit receipt please see the "SSDI/SSI Disability Episodes" variables.

## Cross Wave Differences in Original HRS Data

The Disability section of the HRS asks questions about whether the Respondent has applied for disability benefits from Social Security Disability Insurance (SSDI) or Supplemental Security Income (SSI) in every wave. Before Wave 5, the questions ask about the two programs together. From Wave 5 forward, the questions ask about the programs separately.

Beginning in Wave 5, Respondents who are receiving SSDI or SSI benefits are asked how much they receive each month. If they report benefits have stopped, they are asked how much they received in the last month that they received benefits. Beginning in Wave 7, it is also recorded whether an SSDI benefit has converted to Social Security (OASDI). Those who converted to Social Security have SSDI as their disability type, and the amount they received for disability is for their last month with SSDI.

## General Comments

Beginning with the RAND HRS Longitudinal File 2020 (V2), the variables in this section have been updated to incorporate changes implemented in the recent HRS release of the [Cross-Wave Prospective Social Security Wealth Measures of Pre-Retirees](#). This release replaces all other public-use Social Security wealth data products from HRS, expands the data to cover every wave, and recalculates the wealth measures in earlier waves based on newly available linked Social Security earnings records as of 2020. It is important to note that the method for calculating the Social Security wealth amounts has changed considerably. Therefore, users should expect to see substantial differences compared to the previous version. Please review the "How Constructed" documentation below for more information.

## How Constructed

The Predicted Social Security wealth of Pre-retirees is taken directly from the HRS Cross-Wave Prospective Social Security Wealth Measures of Pre-Retirees 1992-2020 file.

These measures are constructed using the HRS survey data as well as SSA's administrative records and are only calculated for

individuals who have not yet retired (as evidenced by claiming SS benefits). Analysts interested in SS wealth for current retirees should apply for access to the restricted version of the SS wealth file from HRS directly.

RwSSWRER is the Respondent's predicted SS wealth based on their retirement insurance benefit and is calculated using the Respondent's own earnings records, assuming a claim age of 62. RwSSWRNR is the same calculation assuming a full retirement claim age, and RwSSWRXA is the calculation assuming a claim age of 70.

RwSSWSER is the Respondent's predicted SS wealth based on their incremental auxiliary spouse benefit and is calculated using the spousal and/or survivor benefit based on their spouse's earning history, assuming a claim age of 62. RwSSWSNR is the same calculation assuming a full retirement claim age, and RwSSWSXA is the calculation assuming a claim age of 70.

Please refer to the [Cross-Wave Prospective Social Security Wealth Measures of Pre-Retirees](#) documentation for more details.

RwCLAIMED is an indicator variable (0 = No, 1 = Yes) that says whether the Respondent has already claimed SS benefits as of the wave date. If RwCLAIMED=1, then all the Respondent retirement insurance benefit wealth variables will be missing.

SwSSWRER, SwSSWRNR, SwSSWRXA, SwSSWSER, SwSSWSNR, SwSSWSXA, and SwCLAIMED are the analogous spouse variables.

Household-level versions of the Social Security wealth measures that combine the information in the corresponding Respondent and spouse variables are also provided:

The individual components used to derive HwSSWRER, assuming both the Respondent and spouse claim at age 62, are: RwSSWRER, RwSSWSER, SwSSWRER, and SwSSWSER.

The individual components used to derive HwSSWRNR, assuming both the Respondent and spouse claim at their respective full retirement ages, are: RwSSWRNR, RwSSWSNR, SwSSWRNR, and SwSSWSNR.

The individual components used to derive HwSSWRXA, assuming both the Respondent and spouse claim at age 70, are: RwSSWRXA, RwSSWSXA, SwSSWRXA, and SwSSWSXA.

For all of the Respondent-level SS wealth variables, if the Respondent's age is at or above the assumed claim age, then the variable is set to .A=N/A due to age. If the Respondent has already claimed Social Security, the variable is set to .C=Already Claimed. If the Respondent is ineligible to have a predicted wealth variable because they fall into the CODA or AHEAD cohorts, not included in the Cross-Wave Prospective Social Security Wealth Measures of Pre-Retirees file, the variable is set to .N=R ineligible for SSW measure. If the value is missing for any other reason, then the variable is set to .M=Other Missing. The spouse SS wealth variables also use these missing values along with .U=Unmarried and .V=Spouse NR.

## General Comments

For Waves 1-10, receipt of pension income variables are based on information given about pensions in the Assets and Income section and do not consider information given about past pensions in the Employment section. The relevant pension questions are reported at the household-level and are asked only of the Financial Respondent about the Financial Respondent's pension income and, if married, the Financial Respondent's spouse's pension income. Adjustments are made when these measures are merged to the Respondent level, depending on whether the Respondent is the Financial Respondent or not. If the Respondent is the Financial Respondent, then measures concerning the Financial Respondent are assigned to the Respondent and those about the Financial Respondent's spouse are assigned to the Respondent's spouse. But if the Respondent is not the Financial Respondent, then measures about the Financial Respondent are assigned to the Respondent's spouse and those concerning the Financial Respondent's spouse are assigned to the Respondent.

Beginning in Wave 11, the questionnaire introduced a stand-alone Pension section, and information from this section is used to generate pension income variables when information from the Assets and Income section is not available. In the Pension section, relevant questions are reported at the pension level and are asked of both Financial and non-Financial Respondents who are currently working or who have previously reported having employer-provided pension plans.

## How Constructed

RwPENINC indicates whether the Respondent is currently receiving any pension income. SwPENINC provides the information for the Respondent's spouse or partner.

In Wave 2H and from Wave 3 forward, if the Respondent or both the Respondent and spouse/partner are currently receiving pension income, then RwPENINC is set to yes (=1). If no one or only the spouse/partner is receiving pension income, then RwPENINC is set to no (=0).

Beginning in Wave 11, information from the standalone Pension section is incorporated for Respondents who do not have available information in the Assets and Income Section. Using data from the Pension section, RwPENINC is set to yes (=1) if the Respondent indicates that they receive any income from up to ten individual pension plans. If the Respondent does not indicate receiving income from any plans, RwPENINC is set to no (=0).

Otherwise, RwPENINC is set to a missing value based on missing values in HRS variables.

If the spouse/partner or both are currently receiving pension income, then SwPENINC is set to yes (=1). If no one or only the Respondent is receiving pension income, then SwPENINC is set to no (=0). Otherwise, SwPENINC is set to a missing value based on missing values in HRS variables.

If the Respondent is not married, SwPENINC is set to .U=unmarried.

These variables are included to provide context to the measure about continuation of a pension after death. Since that question is not asked in Waves 1 and 2A, the measure is not included for these earlier waves at this time. See the "Whether pensions can continue" section for more information.

## Cross Wave Differences in Original HRS Data

The question wording in the Assets and Income Section is consistent across waves. There are two questions that ask whether the Financial Respondent and/or spouse are currently receiving pension income.

The first question asks: "Are you (or your (husband/wife/partner)) currently receiving an income from retirement pensions?" If yes, a subsequent question asks: "Who receives that?" The answers may be "RESPONDENT ONLY," "SPOUSE/PARTNER ONLY" or "BOTH."

Beginning in Wave 11, information from the standalone Pension section is incorporated for Respondents who do not have available information in the Assets and Income section. The question, "Are you currently receiving regular payments from your [plan name]?"

is asked of both the Financial and non-Financial Respondent if they report having an employer-provided pension plan. The question wording is consistent from Wave 11 forward.

## General Comments

For Waves 1-10, receipt of pension income variables are based on information given about pensions in the Assets and Income section and do not consider information given about past pensions in the Employment section. The relevant pension questions are reported at the household-level and are asked only of the Financial Respondent about the Financial Respondent's pension income and, if married, the Financial Respondent's spouse's pension income. Adjustments are made when these measures are merged to the Respondent level, depending on whether the Respondent is the Financial Respondent or not. If the Respondent is the Financial Respondent, then measures concerning the Financial Respondent are assigned to the Respondent, and those about the Financial Respondent's spouse are assigned to the Respondent's spouse. But if the Respondent is not the Financial Respondent, then measures about the Financial Respondent are assigned to the Respondent's spouse and those concerning the Financial Respondent's spouse are assigned to the Respondent.

Beginning in Wave 11, the questionnaire introduced a standalone Pension section, and information from this section is used to generate pension income variables when information from the Assets and Income section is not available. In the Pension section, relevant questions are reported at the pension level and are asked of both Financial and non-Financial Respondents who are currently working or who have previously reported having employer-provided pension plans.

## How Constructed

RwPENI\_N indicates the number pension plans from which the Respondent is currently receiving income. SwPENI\_N provides this information for the Respondent's spouse or partner.

In Wave 2H and from Wave 3 forward, a series of questions are asked in the Assets and Income section concerning the number of pension plans from which the Respondent received income in the last calendar year. If the Respondent reports receiving other income from retirement pension plans, then the Respondent is asked if they receive income from more than one retirement pension plan, and if so, how many. RwPENI\_N is set to the number of pension plans that the Respondent reports.

Beginning in Wave 11, information from the standalone Pension section is incorporated for Respondents who do not have available information in the Assets and Income Section. In the Pension section, the Respondent is asked whether they receive any income from up to ten individual pension plans, and RwPENI\_N is equal to the number of plans where the Respondent answers "yes."

If the Respondent is currently not receiving any pension income, then RwPENI\_N is set to .Z. If the Respondent reports 10 or more pensions, they are considered an outlier and coded as .M. Otherwise, RwPENI\_N is set to a missing value based on missing values in HRS variables.

SwPENI\_N is constructed in the same way. If the Respondent is not married, SwPENI\_N is set to .U=unmarried.

These variables are included to provide context to the measure about continuation of a pension after death. Since that question is not asked in Waves 1 and 2A, that measure is not included for these earlier waves at this time. See the "Whether pensions continue" section for more information.

### Cross Wave Differences in Original HRS Data

There are two questions in the Assets and Income Section regarding the number of pension plans from which income is currently received. They are asked separately about the Financial Respondent and spouse/partner if the individual is receiving any pension income.

The first question is: "Do [you (yourself)/your spouse/partner] receive income from more than one retirement pension?" If "yes," another question asks: "How many retirement pensions do [you/your spouse/partner] receive?"

In Wave 2H, if the answer to the first question is "no," then the second question is set to "0" in the raw data. From Wave 3 and forward, if the answer to the first question is "no," the number of pensions question is filled with "1" in the raw data.

Beginning in Wave 11, information from the standalone Pension section is incorporated for Respondents who do not have available information in the Assets and Income section. The question, "Are you currently receiving regular payments from your [plan name]?" is asked of both the Financial and non-Financial Respondent if they report having an employer-provided pension plan. The question wording is consistent from Wave 11 forward.

## General Comments

For Waves 1-10, receipt of pension income variables are based on information given about pensions in the Assets and Income section and do not consider information given about past pensions in the Employment section. The relevant pension questions are reported at the household-level and are asked only of the Financial Respondent about the Financial Respondent's pension income and, if married, the Financial Respondent's spouse's pension income. Adjustments are made when these measures are merged to the Respondent level, depending on whether the Respondent is the Financial Respondent or not. If the Respondent is the Financial Respondent, then measures concerning the Financial Respondent are assigned to the Respondent, and those about the Financial Respondent's spouse are assigned to the Respondent's spouse. But if the Respondent is not the Financial Respondent, then measures about the Financial Respondent are assigned to the Respondent's spouse and those concerning the Financial Respondent's spouse are assigned to the Respondent.

Beginning in Wave 11, the questionnaire introduced a standalone Pension section, and information from this section is used to generate pension income variables when information from the Assets and Income section is not available. In the Pension section, relevant questions are reported at the pension level and are asked of both Financial and non-Financial Respondents who are currently working or who have previously reported having employer-provided pension plans.

## How Constructed

RwPENIC1 and RwPENIC2 indicate whether the Respondent's estate can continue to collect income from pension plan #1 and pension plan #2 after the Respondent's death. SwPENIC1 and SwPENIC2 provide this information for the Respondent's spouse or partner.

RwPENIC1 and RwPENIC2 simply recode for missing values. RwPENIC1 is set to .Z if the Respondent receives no pension income. RwPENIC2 is set to .Z if the Respondent receives no pension income or pension income from a single plan.

R3PENIC1 and R3PENIC2 are set to .U for Wave 3A Respondents who are unmarried. Similarly, beginning in Wave 11, if we use the standalone Pension section as the variable source (see General Comments, above), RwPENIC1 and RwPENIC1 will be set to .U if the Respondent is unmarried.

The spouse measures are constructed in the same way. If the Respondent is not married, SwPENIC1 and SwPENIC2 are set to .U=unmarried.

Because this question is not asked in Waves 1 and 2A, the measure is not included for these earlier waves.

### Cross Wave Differences in Original HRS Data

In all waves of the Assets and Income section, these questions are only asked if the Financial Respondent reports that a member of the household has received pension income. The questions are preceded by a question that asks how long the pension income will be received.

In Wave 2H and from Wave 3 forward, the question asks: "If you were to die (before then [if the pension is received for a limited number of years]), would the payment stop, continue unchanged, or continue at a reduced level?" There are 4 answers: "1.Stop," "2.Continue unchanged," "3.Continue at a reduced level" or "7.Other."

In Wave 4 and Wave 5, one more answer is added: "4. Lump sum paid to beneficiary."

The same question is asked about the second pension income if two or more pensions are reported.

In Wave 3A, the question was not asked of single Respondents.

Beginning in Wave 11, information from the standalone Pension section is incorporated for Respondents who do not have available information in the Assets and Income section. The question, "If you should die, would your [husband/wife/partner] continue to receive the same payment, get a reduced payment or would the payment end?" is asked of both the Financial and non-Financial Respondent if they report pension income from an employer-provided pension plan and are not single. The question wording is consistent from Wave 11 forward.

## How Constructed

RwJCPEN indicates whether the Respondent has any pension plan from the current job, and RwJCPENF provides additional detail about the source of information for RwJCPEN. SwJCPEN and SwJCPENF provide the information for the Respondent's spouse or partner.

Until Wave 9, the set of questions asked differs depending on whether the Respondent had a pension and worked for the same employer in the previous wave or not. Whether the Respondent is considered to have had a pension in the previous wave is indicated by a preloaded variable. Considerably more information is collected about pensions that are newly reported or where the rules have changed. RwJCPENF indicates which situation applies to the Respondent in Wave "w."

If the Respondent is working, questions ask about the current job's pension plan. If the current job is newly reported in a given wave or if the Respondent was not included in a pension plan with the current employer at the previous wave, the Respondent is asked if they are included in a pension plan and if so, how many. In follow-up questions, characteristics of the plans are collected. Before Wave 5, questions ask about up to three plans. From Wave 5 to Wave 10, they ask about up to four. From Wave 11 forward, the Respondent answers questions about all pension plans. To remain consistent with earlier waves, we report employee contributions for up to the first four reported plans that are associated with the current job.

RwJCPEN is set to yes (=1) if the Respondent reports being included in a pension plan and subsequently reports at least one pension plan when asked how many, or if the Respondent reports at least one plan type. If the Respondent responds "no" to the inclusion question or if the number of pension plans is "zero" and no plan type is reported, then RwJCPEN is set to no (=0). RwJCPENF (=6)

flags cases where RwJCPEN is set to "no" based on the number of plans being zero.

If the Respondent is working for the same employer as in the previous wave and was included in a pension plan, then they are asked if the rules of the pension have changed. If the Respondent indicates that the rules have changed, they are asked the complete set of questions about newly reported pensions. If the rules have not changed, a limited number of follow-up questions about pension characteristics are asked, with the exception of Wave 7 where the Respondent is asked the complete set of questions regardless of whether the rules have changed. The Respondent may also deny having the pension.

If the Respondent is working for the same employer as in the previous wave, was included in a pension plan, and the rules have not changed, then RwJCPEN is assumed to be yes (=1), unless either the pension is denied, or the number of plans reported is zero and no plan type is given. If the Respondent denies having a pension, RwJCPEN is set to "zero," and RwJCPENF (=8 or 9) indicates the denial along with whether the data show the Respondent reporting a pension in the previous wave. Whether or not the Respondent indicates a rules change, RwJCPEN is set to no (=0) if the number of plans reported is zero, and if no plan type information is reported. RwJCPENF (=2 or 5) indicates whether this was done, as well as whether a rules change was reported (=1, 2, or 3) or not (=4 or 5). If the number of plans reported is "zero" and any plan type information is provided, the presence of plan types are used to count the number of pensions, and RwJCPENF (=3) flags that this was done.

In some cases, information appears in both sets of questions, usually when the Respondent reports having more than three (or four) pensions for which the rules did not change. These cases are flagged by RwJCPENF (=7), and only the information associated with no rules change is used.

In Waves 9 and 10, the pension questionnaire changed. The skip patterns are less complicated, and less information is collected. We do not include RwJCPENF from Wave 9 forward because all Respondents are asked if they have a pension plan from their current job right at the beginning of the section. So, unlike previous waves, there is only one way the Respondent is asked this question.

Beginning in Wave 11, the pension questionnaire changed again, and it aims to establish a complete inventory of all pensions that the Respondent may have pertaining to current or any prior jobs. The Respondent is first asked about all pensions that they reported in a previous wave, as well as any new pensions the Respondent may have. This inventory of pensions is recorded in the data at the pension level so that one Respondent can have multiple observations depending on the number of past and current pensions they hold. We have aggregated these pension records to create Respondent-level variables that are derived for longitudinal comparison to the current pension. Plans are assigned as active or inactive (dead) based on their status for the purpose of controlling follow-up questions. In addition, blocks of questions are asked dependent upon whether a plan is from a new job or previous wave job. From Wave 11 forward, RwJCPEN is set to yes (=1) if the Respondent indicates they are included in a pension plan on their current job or they have money in a retirement account through their current job, and the plan is assigned as active. RwJCPEN is also set to yes (=1) if the Respondent reports an active pension that is not on the current job but has a valid job start date and a missing end date, indicating that the pension does refer to the current job. Lastly, RwJCPEN is set to yes (=1) when the Respondent has a new plan or a preloaded plan, and the Respondent is currently enrolled in a plan.

RwJCPEN is set to .W if skipped because the Respondent has no current job.

RwJCPEN is set to .M if the Respondent has a current job but did not respond to the pension questions.

SwJCPEN and SwJCPENF information is taken from the spouse's self-reported RwJCPEN and RwJCPENF variables, if available. If the Respondent is not married, SwJCPEN and SwJCPENF are set to .U=unmarried. If the Respondent's spouse did not respond, then SwJCPEN and SwJCPENF are set to .V=Spouse is non-response.

Because this question is not asked in Wave 2A, the variables are set to .Q.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, questions ask about the current job's pension. The wording differs depending on whether the Respondent is self-employed or not. For the self-employed, the question asks: "Aside from IRA or Keogh plans, are you included in any pension plans or tax-deferred savings plans through your work?" For those employed by a firm, the question asks: "Now I'd like to ask about pension or retirement plans on your job, sponsored by your employer or union. This includes not only basic pension or retirement plans, but also tax-deferred

plans like thrift, savings, 401k, deferred profit-sharing, or stock ownership plans. Are you included in any such pension, retirement, or tax-deferred plan with this employer?"

In Wave 2H, 3H and from Wave 4 to Wave 11, those who are with the same employer and who reported having a pension at the previous wave are asked if the rules have changed. Those working who a) did not report a current job pension in the previous wave or b) who changed jobs between waves are asked if they are included in a pension plan on the current job. The question wording differs depending on whether the Respondent is self-employed or not.

Those with a pension in a previous wave and who were employed by the same firm or self-employed in the current and previous waves are asked: "Have the rules that govern your pension benefits or the age you can receive them changed since [PREVIOUS WAVE MONTH/YEAR]?" For those employed by a new firm or employed by the same firm without a previous wave pension, the question is the same as that asked of firm employees in Wave 1. For those who are newly self-employed or still self-employed without a previous wave pension, the question is the same as that in Wave 1, preceded by the statement: "Now I'd like to ask about pension or retirement plans on your job."

The questions are not asked in Wave 2A.

In Wave 3A, only the questions about the current job's pension plan are asked, with the same wording as in Wave 1.

Except in Wave 7, a limited number of follow-up questions about pension characteristics are asked of those who: a) report working for the same employer as in the previous wave, b) were included in a pension plan at that time, and c) indicate that the rules have not changed. In Wave 7 only, the Respondent is asked the complete set of follow-up questions about the current job pension regardless of whether the rules have changed. In all waves, the complete set of questions is asked of all those who: a) report having a new current job pension, i.e., those who changed jobs or self-employment status between waves, b) did not report having a current job pension at the prior wave, c) report a rules change in the pension they had in the previous wave, or d) are new to the HRS study.

In Waves 9 and 10, the pension questionnaire changed. The skip patterns are less complicated and less information is collected. As a result, we do not include RwJCPENF for these waves (or for any wave after Wave 8). All Respondents are asked at the beginning of the section if they have a pension from their current job. So, unlike previous waves, there is only one way the Respondent is asked this question.

Beginning in Wave 11, there was a major change as to how HRS records Respondents' pensions. The Respondent is no longer asked how many pensions they have. Instead we derive RwJCPEN from employment variables that ask if the Respondent has a pension on their current job in conjunction with questions that elicit an inventory of all pensions that the Respondent may have and indicates which pensions are active or inactive. We also use job start and end dates to determine if the pension is from the current employment.

## How Constructed

RwPENCT indicates the number of pension plans that the Respondent has from their current job. SwPENCT provides the information for the Respondent's spouse or partner.

If the Respondent indicates that they have a pension plan from the current job, they are asked for the number of plans. RwPENCT is set to the number of pension plans that the Respondent reports. If the Respondent reports zero plans but provides any pension type information, RwPENCT is set to the number of plans with pension type information.

RwPENCT is set to .S if the Respondent has no pension in the current job, is missing whether they have a pension, or is not working. It is set to .Z if the Respondent reports having zero pension plans and does not provide any plan type information. Note that in this situation, RwJCPEN is set to "no." From Wave 6 to Wave 9, if the Respondent does not know the number of plans, a follow-up question asks if it is more than one. If the response is one plan then RwPENCT is set to "1." If it is more than one, then RwPENCT is set to "2." Otherwise, RwPENCT is set to other missing values as appropriate based on the missing values coded in the HRS variables.

Until Wave 8, RwJCPENF indicates if RwPENCT is set based on the number of plans with pension type information or using the follow-up question about whether there is just one plan or more than one. The relevant RwJCPENF codes are 3, 10, and 11.

From Wave 9 forward, RwJCPENF is not included in the RAND HRS Longitudinal File because, unlike previous waves, there is only one way the Respondent is asked if they have a pension on the current job.

In Wave 11, the pension questionnaire changed. From Wave 11 forward, the Respondent is no longer asked the number of pension plans from the current job. Therefore, RWPENCT is constructed by using employment and pension questions that together identify the pension plan as being associated with the current job. We then sum these plans to get the total number of pension plans associated with the current job.

SwPENCT information is taken from the spouse's self-reported RWPENCT variable, if available. If the Respondent is not married, SwPENCT is set to .U=unmarried. If the Respondent's spouse did not respond, then SwPENCT is set to .V=Spouse is non-response.

Because this question is not asked in Wave 2A, the variables are set to .Q.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, the Respondent is only asked about the number of pension plans if they report being included in a pension plan associated with the current job. The question asks: "In how many different pension plans of this sort are you included on this job?"

In Wave 2H, 3H and from Wave 4 to Wave 10, those who are with the same employer and who reported having a pension at the previous wave are asked if the rules have changed. Except in Wave 7, if the Respondent reports no rules change, a question asks about the number of pensions: "In how many different pension plans are you included on this job?". From Wave 2 to Wave 9, including Wave 7, if there is no rules change or if there is no prior wave pension with the current employer but the Respondent reports one in the current wave, the question wording for the number of pensions is the same as that asked in Wave 1. RwjCPENF indicates the source of the pension information (rules change, no rules change, or, if no additional information, for a new pension). From Wave 9, RwjCPENF is not included in the RAND HRS Longitudinal File because, unlike previous waves, there is only one way the Respondent is asked if they have a pension on the current job.

In Wave 2H, the questions are asked separately for those employed by a firm and the self-employed, but the question wording is the same for both.

In Wave 3A, only the questions about the current job's pension plans are asked, and they are asked in two places. The wording in both places is the same as in Wave 1.

The questions are not asked in Wave 2A.

From Wave 6 to Wave 10, those who do not know the number of pensions are asked a follow-up question: "Is this just one plan or more than one?" The answers may be one plan or more than one plan.

In Wave 7, values 8 and 9 are missing value codes and so it is not possible for anyone to have more than 7 pension plans. In other waves, the missing value codes are 98 and 99.

In Wave 11, the pension questionnaire changed. It aims to establish a complete inventory of all pension plans that the Respondent may have associated with the current or any previous jobs. From Wave 11 forward, the Respondent is first asked about all pensions that they reported in a previous wave, as well as any new pensions the Respondent may have. This inventory of pensions is recorded in the data at the pension level so that one Respondent can have multiple observations depending on the number of past and current pension plans they hold. We have aggregated these pension records to create Respondent-level variables that are derived for longitudinal comparison to the current pension variables.

Because the Respondent is no longer asked how many pensions they have, RWPENCT is constructed by using employment and pension questions that together identify the pension as being associated with the current job. We then sum these pensions to get the total number of pension plans associated with the current job.

## How Constructed

RwPTY1, RwPTY2, RwPTY3 and RwPTY4 indicate the types of pension plans in which the Respondent is included at their current job. Before Wave 5, the Respondent may report the type of up to three pension plans. From Wave 5 through Wave 10, the Respondent may report the type of up to four pension plans. SwPTY1, SwPTY2, SwPTY3 and SwPTY4 provide this information for the Respondent's spouse or partner. From Wave 11 forward, the Respondent can report the type of an unlimited number of pension plans, but we limit the RAND HRS Longitudinal File to the first four reported plans from the current job to align with previous waves.

If the Respondent is included in a pension through their current job then they are asked for the type of plan. The Respondent

may identify the plan type as Type A, Type B, or both. A Type A plan refers to a defined benefit (DB) plan, and a Type B plan refers to a defined contribution (DC) plan. RwPTYYP1, RwPTYYP2, RwPTYYP3 and RwPTYYP4 are set to the types of pensions that the Respondent reports. The plan type is simply recoded for missing values. It is set to .S if the Respondent does not have the pension, e.g., if the Respondent has one pension, RwPTYYP2 and RwPTYYP3 (or RwPTYYP4 from Wave 5 on) are set to .S. They are also set to .S if the Respondent does not have a pension associated with the current job, did not provide a number of pensions (for waves prior to Wave 11), or is not working.

SwPTYYP1, SwPTYYP2, SwPTYYP3 and SwPTYYP4 information is taken from the spouse's self-reported RwPTYYP1, RwPTYYP2, RwPTYYP3 and RwPTYYP4 variables, if available. If the Respondent is not married, SwPTYYP1, SwPTYYP2, SwPTYYP3 and SwPTYYP4 are set to .U=unmarried. If the Respondent's spouse did not respond then SwPTYYP1, SwPTYYP2, SwPTYYP3 and SwPTYYP4 are set to .V=Spouse is non-response.

Because this question is not asked in Wave 2A, the variables are set to .Q.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, if the Respondent reports having a pension(s) from the current job, the number of pensions is ascertained, and the type of pension is requested for up to three pensions. The question asks: "I would like to know what type of plan this is. In some retirement plans, Type A, benefits are usually based on a formula involving age, years of service and salary. In other plans, Type B, money is accumulated in an account for you. Is your plan Type A or Type B?" The response may be Type A, Type B, or both. Type A refers to a defined benefits (DB) plan, and Type B refers to a defined contributions (DC) plan.

If the Respondent has more than one plan, for subsequent plans the question is preceded by the phrase: "About the (next) most important of these plans..."

In Wave 2H, 3H and from Wave 4 forward, those who are with the same employer and who reported having a pension at the previous wave are asked if the rules have changed. Except in Wave 7, if no rules change is reported, a limited number of follow-up questions are asked, including the number of plans and their types. In all waves, including Wave 7, if there is not a rules change or if there is not a prior wave pension with the current employer but the Respondent reports one in the current wave, a more complete set of questions is asked. These questions include the number of plans and their types.

In both places, the wording is the same as that in Wave 1 with a slight variation in the preface if there is more than one plan. The question is preceded by the statement: "Now I have some questions about the (next) most important of these plans."

In Wave 2H, the questions are asked separately for those employed by a firm and the self-employed, but the question wording is the same for both.

In Wave 3A, the questions about the current job's pension plan(s) are asked in two places depending on whether the Respondent works for a firm or is self-employed. The wording in both places is the same as in Wave 1. Respondents who work at a firm are asked a set of questions reporting on up to three plan types. The self-employed are asked a set of questions reporting on only one plan type.

The questions are not asked in Wave 2A.

Beginning in Wave 5, a fourth plan type is asked if the Respondent reports having at least four plans.

Prior to Wave 11, the Respondent was asked to list pension plans in order of importance. From Wave 11 forward, due to the questionnaire change, the Respondent answers questions about all pension plans, with no regard to importance.

## How Constructed

RwPTYPD1, RwPTYPD2, RwPTYPD3 and RwPTYPD4 indicate the detailed types of pension plans in which the Respondent is included for the current job. This is a new question starting in Wave 9. SwPTYPD1, SwPTYPD2, SwPTYPD3 and SwPTYPD4 provide this information for the Respondent's spouse or partner.

From Wave 9 forward, if the Respondent is included in a pension in their current job then they are asked what their employer calls the plan. The Respondent may identify the plan type from a list of different plans such as 401K or 403B. In Wave 9, two new codes were added: "IRA/Keogh" (95) and "health savings account/medical plan/flexible spending account/disability mentioned" (96). RwPTYPD1-4 is recoded from these two codes to "96:Not a pension." In Wave 10, code 95 was dropped and code 96 was simplified to "Not a pension." In Wave 11, the pension questionnaire changed, but the Respondent is still asked what type of pension they have, so the response remains the same.

RwPTYPD1, RwPTYPD2, RwPTYPD3 and RwPTYPD4 are set to the type of pensions that the Respondent reports. The plan type is simply recoded for missing values. It is set to .S if the question is skipped because the Respondent does not have the pension, e.g., if the Respondent has one pension, RwPTYPD2 to RwPTYPD3 (or RwPTYPD4 from Wave 5 on) are set to .S. They are also set to .S if the Respondent does not have a pension on the current job, did not provide a number of pensions, or is not working.

From Wave 9 forward, there are two RAND HRS pension type variables: RwPTYPD1-4 indicates if a plan is DB, DC, Both, or Not a Pension and RwPTYPF1-4 indicates what the Respondent's employer calls their plan. The flags RwPTYPF1, RwPTYPF2, RwPTYPF3 and RwPTYPF4 provide a crosswalk between the two plan type variables. They indicate whether the Respondent's responses in RwPTYPD1-4 match those in RwPTYPF1-4.

RwPTYPF1-4 = 1 if the Respondent can correctly identify a DB and DC plan from the employer list.

RwPTYPF1-4 = 0 if the Respondent cannot identify a DB and DC plan from the employer list.

RwPTYPF1-4 = .S if the Respondent does not report a pension.

RwPTYPF1-4 = .R if the Respondent refused to answer both RwPTYPD1 and RwPTYPF1.

RwPTYPF1-4 = .N if the Respondent reports "Not a pension" in RwPTYPD1-4.

RwPTYPF1-4 = .D if both RwPTYPDx and RwPTYPFx report DK or if RwPTYPFx is reported as '.O Other.' As we do not have information on what the 'Other' plan is, we cannot say if the Respondent has correctly identified it as DB or DC.

SwPTYPD1-4 and SwPTYPF1-4 information is taken from the spouse's self-reported RwPTYPD1-4 and RwPTYPF1-4 variables, if available. If the Respondent is not married, SwPTYPD1-4 and SwPTYPF1-4 are set to .U=unmarried. If the Respondent's spouse did not respond, then SwPTYPD1-4 and SwPTYPF1-4 are set to .V=Spouse is non-response.

## Cross Wave Differences in Original HRS Data

From Wave 9 forward, the question asks about pension plans associated with the Respondent's current job.

If the Respondent reports having one or more pension plans from the current job, the number of pensions is ascertained and the Respondent is asked "What does your employer call your plan?" This detailed type of pension is requested for up to four pensions. If the Respondent has multiple plans of different types, the most important plan is recorded rather than combining them as "Combination Plan."

Prior to Wave 11, the Respondent was asked to list their pensions in order of importance. From Wave 11 forward, due to the questionnaire change, the Respondent answers questions about all their pensions, with no regard to importance.

The Respondent is also asked "Is your plan Type A or Type B?" The response may be Type A, Type B, or both. RwPTYPF1-4 tells us if the Respondent correctly identifies the employer plan name as DB, DC or both.

## How Constructed

RwDCCONT1, RwDCCONT2, RwDCCONT3 and RwDCCONT4 indicate the amount in nominal dollars that the Respondent contributes annually to a defined contribution pension plan at their current, primary job. Before Wave 5, employee contributions may be reported for up to 3 plans. From Wave 5 through Wave 10, employee contributions may be reported for up to 4 plans. From Wave 11

forward, Respondents may report information on up to 10 plans, but we are limiting the RAND HRS Longitudinal File to the first four active plans as they appear in the data, to align with previous waves. SwDCCONT1, SwDCCONT2, SwDCCONT3 and SwDCCONT4 provide this information for the Respondent's spouse or partner.

If the Respondent is working for the same employer as in the previous wave and was previously included in a pension plan, then they are asked if the rules of the pension plan have changed. If the Respondent indicates that the rules have changed, they are asked the complete set of questions about newly reported pensions. Prior to Wave 6, if the rules have not changed, Respondents are not asked how much they contribute to the plan, and these responses are set to .Q. Beginning in Wave 6, all Respondents are asked how much they contribute to each defined contribution plan.

If the Respondent is included in a pension in their current job, then they are asked for the type of plan. In Waves 1-8 and Wave 11 forward, employee contributions are calculated for Respondents who indicate a plan type of Type B or both. In Waves 9-10, dollar amounts are calculated for Respondents who either a) consistently identify a defined contribution plan through the plan type (i.e., Type B or both) and the detailed plan name (e.g., 401K, 403b, etc.) or b) indicate a plan type of Type B or both and have a high level of confidence in their plan type selection. In all Waves, Respondents who indicate a plan type of Type A (defined benefit), or who do not know or refuse to disclose the plan type, are set to .B.

In all Waves, Respondents have the option to report employee contributions as a percentage of their annual wages or as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are annualized. If the Respondent reports contributions as a percentage, annual contributions are calculated by multiplying the reported percent by the Respondent's annual wages from their current, primary job. If the Respondent reports contributions as a fixed dollar amount per time period, annual contributions are calculated based on the hours and weeks the Respondent reports working for their current, primary job.

If the amount contributed is missing, the variables are recoded. RwDCCONTx is set to .Q for defined contribution plans if the questions are not asked of any Respondent in a given wave (e.g., Respondents to Wave 2A or Respondents with plans with no rule changes in Waves 2H-5). If the Respondent does not have a given pension plan, the variables are set to .S (e.g., if the Respondent has one pension, RwDCCONT2, RwDCCONT3, and from Wave 5 on, RwDCCONT4 equal .S). RwDCCONTx is also set to .S if the Respondent does not have a pension plan associated with the current job, or does not provide a number of pension plans in waves prior to 11. RwDCCONTx is set to .W if the Respondent is not working, and to .K if one of the following is missing: wage information, the amount period, hours worked or weeks worked on primary job.

### **Cross Wave Differences in Original HRS Data**

In Waves 1-8 and Wave 11 forward, employee contributions to a defined contribution plan are calculated for Respondents who indicate a plan type equal to Type B or Both. In Waves 9 and 10, DC plans are defined in one of two ways: a) plans that are consistently identified as DC through the plan type (i.e., Type B or both) and the detailed plan name (e.g., 401K, 403b, etc.) or b) plans with a type of Type B or Both where Respondents have a high level of confidence in their plan type selection.

The wording of the employee contribution question varies slightly across waves and in some cases, by plan type. In Waves 1, 2H, 3A and 3H, all Respondents are asked, "How much do you contribute (as a percent of your pay or amount of money per month or year)?" This wording is also used for Respondents in Wave 4 who indicate that they have a newly reported plan with a plan type of both.

In Waves 4-8, for Respondents who indicate a newly reported Type B plan, or who in Waves 6 and 8 indicate a previously reported plan, the question is worded as follows, "How much do you currently contribute, that is, what is the sum of any amount that you are required to contribute plus any amount that you voluntarily contribute?"

For newly reported plans with a plan type of both in Waves 5-8, the question is worded as, "How much do you currently contribute, either as a percent of your pay or as an amount of money per month or year?"

Beginning in Wave 9, two separate questions are asked of the Respondent about each plan. The first asks, "Do you make any contributions toward [that plan/(plan name)]?" The second has the same wording as those for newly reported plans in Waves 5-8.

In Waves 2H and 3A, the questions are asked separately for those employed by a firm and those that are self-employed. The question wording is the same in both places.

In Wave 3A, Respondents who work at a firm are asked to report on employee contributions to up to three plans. The self-employed are asked to report on only one plan.

In Waves 2H, 3A, 3H, 4 and 5, employee contribution questions are not asked of those who are with the same employer and who reported having a pension plan at the previous wave where the rules have not changed. The variables for these Respondents are set to .Q.

The questions are not asked in Wave 2A.

Beginning in Wave 5, a fourth plan is added if the Respondent reports having at least four plans.

Prior to Wave 11, the Respondent is asked to list their pensions in order of importance. From Wave 11 forward, due to the questionnaire change, the Respondent answers questions about all pension plans, with no regard to importance. We report employee contributions for up to the first four active plans in the data to remain consistent with earlier waves.

## How Constructed

RwDCBAL1, RwDCBAL2, RwDCBAL3 and RwDCBAL4 indicate the amount in nominal dollars that the Respondent currently has in a defined contribution pension plan account from their current, primary employer. Before Wave 5, account balances may be reported for up to 3 plans. From Wave 5 through Wave 10, account balances may be reported for up to 4 plans. From Wave 11

forward, Respondents may report information on up to 10 plans, but we limit the RAND HRS Longitudinal File to the first four active plans as they appear in the data, to align with previous waves. SwDCBAL1, SwDCBAL2, SwDCBAL3 and SwDCBAL4 provide the information for the Respondent's spouse or partner.

If the Respondent is included in a pension in their current job, then they are asked for the type of plan. In Waves 1-8 and Wave 11 forward, account balances are reported for Respondents who indicate a plan type of Type B or both. In Waves 9-10, dollar amounts are calculated for Respondents who either a) consistently identify a defined contribution plan through the plan type (i.e., Type B or both) and the detailed plan name (e.g., 401K, 403b, etc.) or b) indicate a plan type of Type B or both and have a high level of confidence in their plan type selection. In all Waves, Respondents who indicate a plan type of Type A (defined benefit), or who do not know or refuse to disclose the plan type are set to .B.

If the account balance is missing, the variables are recoded. RwDCBALx is set to .Q for defined contribution plans if the questions were not asked of any Respondent in a given wave (e.g., Respondents to Wave 2A). If the Respondent does not have a particular pension plan, the variables are set to .S (e.g., if the Respondent has one pension, RwDCBAL2, RwDCBAL3, and from Wave 5 on, RwDCBAL4 equal .S). RwDCBALx is also set to .S if the Respondent does not have a pension from the current job, or did not provide a number of pensions in waves prior to 11. RwDCBALx is set .W if the Respondent is not working.

Please note that the high maximum values come directly from HRS raw variables. For example, R8DCBAL1=15,000,000 was reported in KJ307A.

### **Cross Wave Differences in Original HRS Data**

In Waves 1-8 and 11, account balances of a defined contribution plan are calculated for Respondents who indicate a plan type equal to Type B or Both. In Waves 9 and 10, DC plans are defined in one of two ways: a) plans that are consistently identified as DC through the plan type (i.e., Type B or both) and the detailed plan name (e.g., 401K, 403b, etc.) or b) plans with a type of Type B or Both where Respondents have a high level of confidence in their plan type selection.

In Waves 1-10, the wording of the question varies depending on the plan type indicated. Respondents who indicate a Type B plan are asked, "How much money is in your account at present?", whereas Respondents who indicate a plan type of both are asked, "For that part of your plan where money is accumulated in an account, how much is in the account at present?" In Wave 11, for all Respondents, the wording of the question is, "How much is in the [Insert Plan Name] account now?"

Questions are not asked in Wave 2A. All variables are set to .Q.

In Wave 2H, eight separate questions are asked, depending on whether the Respondent is employed by a firm or self-employed, the plan type is Type B or both, and whether the plan is newly reported or the rules have changed, or if it has been previously reported and there have been no rules changes.

In Wave 3A, questions are asked separately for those employed by a firm and the self-employed. Respondents who work at a firm are asked to report on account balances for up to three plans. The self-employed are asked to report on only one plan.

In Waves 3H, 4-6, and 8, Respondents are asked one of four account balance questions depending on plan type and whether the plan is newly or previously reported.

In Waves 9 and 10, only one account balance question is asked of all Respondents, but the wording of the question varies based on plan type, as described above.

Beginning in Wave 5, a fourth plan is added if the Respondent reports having at least four plans.

Prior to Wave 11, the Respondent was asked to list their pensions in order of importance. From Wave 11 forward, due to the questionnaire change, the Respondent answers questions about all pension plans, with no regard to importance. We report account balances for up to the first four active plans in the data to remain consistent with earlier waves.

## How Constructed

RwDCBENE1, RwDCBENE2, RwDCBENE3 and RwDCBENE4 indicate the amount in nominal dollars that the Respondent's current employer contributes annually to a defined contribution pension plan for the Respondent. Before Wave 5, employer contributions may be reported for up to 3 plans. From Wave 5 through Wave 10, employer contributions may be reported for up to 4 plans. From Wave 11 forward, Respondents may report information on up to 10 plans, but we limit the RAND HRS Longitudinal File to the first four active plans as they appear in the data, to align with previous waves. SwDCBENE1, SwDCBENE2, SwDCBENE3 and SwDCBENE4 provide the information for the Respondent's spouse or partner.

If the Respondent is working for the same employer as in the previous wave and was previously included in a pension plan, then they are asked if the rules of the pension plan have changed. If the Respondent indicates that the rules have changed, they are asked the complete set of questions about newly reported pensions. Prior to Wave 7, if the rules have not changed, Respondents are not asked how much their employers contribute to the plan, and these responses are set to ".Q." Beginning in Wave 7, all Respondents are asked how much their employer contributes to each defined contribution plan.

If the Respondent is included in a pension plan through their current job, they are then asked for the type of plan. In Waves 1-8, employer contributions are calculated for Respondents who indicate a plan type of Type B only. In Waves 9-10, dollar amounts are calculated for Respondents who either a) consistently identify a defined contribution plan through the plan type (i.e., Type B or "Both Types" (Type A and Type B)) and the detailed plan name (e.g., 401K, 403b, etc.) or b) indicate a plan type of Type B or "Both Types" (Type A and Type B) and have a high level of confidence in their plan type selection. From Wave 11 forward, dollar amounts are calculated for Respondents who indicate a plan type of Type B or "Both Types" (Type A and Type B). In Waves 1-8, Respondents who indicate a plan type of "Both Types" (Type A and Type B) are not asked questions about employer contribution to the plan, and these responses are set to ".Q." In all Waves, Respondents who indicate a plan type of Type A (defined benefit), or who do not know or refuse to disclose the plan type, are set to ".B."

In all Waves, Respondents have the option to report employer contributions as a percentage of their annual wages or as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are annualized. If the Respondent reports contributions as a percentage, annual contributions are calculated by multiplying the reported percent by the Respondent's annual wages from the

current, primary job. If the Respondent reports employer contributions as a fixed dollar amount per time period, annual contributions are calculated based on the hours and weeks the Respondent reports working for their current, primary job. Beginning in Wave 9, Respondents are also given the option to report employer contributions as a percentage match to their own contribution to the plan, and these values are calculated using RwDCCONTx.

RwDCMODE1, RwDCMODE2, RwDCMODE3, and RwDCMODE4 indicate whether employer contributions are made as a percentage of a Respondent's pay, a fixed dollar amount per time period, or as a matched percent of the Respondent's contribution to their plan. SwDCMODE1, SwDCMODE2, SwDCMODE3, SwDCMODE4 provide the information for the Respondent's spouse or partner.

RwDCPCT1, RwDCPCT2, RwDCPCT3, and RwDCPCT4 indicate the percent of the Respondent's pay the employer contributes to the plan or the percent of the Respondent's contribution that the employer matches. If the employer contributes a fixed dollar amount, RwDCPCTx is set to special missing value ".A." SwDCPCT1, SwDCPCT2, SwDCPCT3, and SwDCPCT4 provide this information for the Respondent's spouse or partner.

If the amount contributed is missing, the variables are coded with special missing values which denote why the contribution is missing. When Respondents report having a defined contribution plan but the employer contribution questions are skipped over, RwDCBENEx is set to special missing value ".Q." (e.g., In Waves 2H-8, Respondents who reported "no rule changes" to their existing plans are not asked employer contribution questions.) If the questions are skipped because the Respondent does not have the pension, the variables are set to ".S" (e.g., if the Respondent has one pension, RwDCBENE2, RwDCBENE3, and from Wave 5 on, RwDCBENE4 equal ".S"). RwDCBENEx is also set to ".S" if the Respondent does not have a pension from the current job or does not provide the number of pensions they have in waves prior to 11. RwDCBENEx is set to ".W" if the Respondent is not working and to ".K" if any of the following are missing: wage information, the amount period, hours worked or weeks worked on primary job.

### **Cross Wave Differences in Original HRS Data**

In Waves 1-8 employer contributions to a defined contribution plan are calculated only for Respondents who indicate a plan type equal to Type B. In Waves 9 and 10, DC plans are defined in one of two ways: a) plans that are consistently identified as DC through the plan type (i.e., Type B or "Both Types" (Type A and Type B)) and the detailed plan name (e.g., 401K, 403b, etc.) or b) plans with a type of Type B or "Both Types" (Type A and Type B) where Respondents have a high level of confidence in their plan type selection. From Wave 11 forward, employer contributions are calculated for Respondents who indicate a plan type equal to Type B or "Both Types" (Type A and Type B).

The wording of the employer contribution question varies slightly across waves. In Waves 1, 2H, 3A, 3H, and 4, all Respondents are asked one question, "How much does your (business/employer) contribute (as a percent of your pay or amount of money per month or year)?"

In Waves 5-8, the wording changes slightly, to "How much does your [business/employer] contribute, either as a percent of your pay or as an amount of money per month or year?"

Beginning in Wave 9, two separate questions are asked of the Respondent about employer contributions to each plan. The first asks, "Does your [business/employer] make any contributions toward [that plan/(plan name)]?" The second is, "How much does your [business/employer] actually contribute, as a percent of your pay, or as an amount of money per month or year?"

In Waves 2H and 3A, the questions are asked separately for those employed by a firm and those that are self-employed. The question wording is the same in both places.

In Wave 3A, Respondents who work at a firm are asked to report on employer contributions for up to three plans. The self-employed are asked to report on only one plan.

In Waves 2H, 3A, 3H, 4, 5, and 6, employer contribution questions are not asked of those who are with the same employer and who reported having a pension plan at the previous wave where the rules have not changed. The variables for these Respondents are set to ".Q."

In Waves 1-8, employer contributions questions are not asked of Respondents indicating a plan type of "Both Types" (Type A and Type B). The variables for these Respondents are set to ".Q."

The questions are not asked in Wave 2A.

For Waves 5-10, the Respondent is asked to report on up to 4 plans.

Prior to Wave 11, the Respondent was asked to list their pensions in order of importance. From Wave 11 forward, due to the questionnaire change, the Respondent answers questions about all their pensions, with no regard to importance. We report employer contributions for up to the first four active plans in the data to remain consistent with earlier waves.

## How Constructed

### Core Interview Variables

RwHIGOV indicates whether the Respondent is currently covered by any government health insurance program. RwGOVMR, RwGOVMD, RwGOVVA and RwGOVOT indicate whether the Respondent is currently covered by Medicare, Medicaid, VA/CHAMPUS and other government health insurance, respectively. SwHIGOV, SwGOVMR, SwGOVMD, SwGOVVA, SwGOVOT provide the information for the Respondent's spouse or partner.

In Waves 1 and 2H, the question asks if the Respondent (and in Wave 1, the Respondent's spouse) is covered by any government health insurance. RwHIGOV is simply recoded to 0/1 for No/Yes and for missing values from this question. No checks are done on the types of government insurance the Respondent subsequently reports. Please note that some Respondents do not list Medicare, Medicaid, or VA/CHAMPUS as any of the types of government insurance that covers them in these waves. The RwGOVMR, RwGOVMD, RwGOVVA and RwGOVOT are derived from the follow-up questions where the Respondent reports all types of government health insurance programs under which they are covered.

In Wave 2A and from Wave 3 forward, separate questions ask about particular kinds of government health insurance. In all these waves, Medicare and Medicaid are asked about separately. In Waves 2A and 3A, another question asks about other government insurance, including CHAMPUS and CHAMP-VA. In Wave 3H and from Wave 4 forward, only CHAMPUS / CHAMP-VA, and, in 2002, TRI-CARE, are mentioned. The RwGOVMR, RwGOVMD, RwGOVVA and RwGOVOT are derived from these questions. In Wave 3H, R3GOVOT is set to .Q since the information is not obtained, and from Wave 4 forward, RwGOVOT is not available. If the Respondent indicates that they are currently covered by any of these types of insurance, then RwHIGOV is set to yes (=1). If the Respondent responds no to current coverage by all of these types of insurance, then RwHIGOV is set to no (=0). Otherwise, RwHIGOV is set to a missing value based on missing values in the HRS variables. Note that coverage by R6GOVVA increases more than expected for a consistently coded measure. This may be because a) TRI-CARE was not included in the question wording prior to 2002; and b) retired military 65 and over and covered by Medicare were not eligible for TRI-CARE prior to 2001.

S1HIGOV, S1GOVMR, S1GOVMD, S1GOVVA and S1GOVOT for Wave 1 are taken from the Financial Respondent's information appropriately. That is, if the Respondent is the Financial Respondent, then S1HIGOV, S1GOVMR, S1GOVMD, S1GOVVA and

S1GOVOT are the Financial Respondent's spouse's information. But if the Respondent is the spouse of the Financial Respondent, then S1HIGOV, S1GOVMR, S1GOVMD, S1GOVVA and S1GOVOT are the Financial Respondent's information.

From Wave 2 on, this information is taken from the spouse's self-reported RwHIGOV, RwGOVMR, RwGOVMD, RwGOVVA and RwGOVOT variable, if available. If the Respondent is not married, SwHIGOV, SwGOVMR, SwGOVMD, SwGOVVA and SwGOVOT are set to .U=unmarried. If the Respondent's spouse did not respond then these are set to .V=Spouse is non-response.

### **Exit Interview Variables**

REHIGOV indicates whether the Respondent was covered by any government health insurance program before death. REGOVMR, REGOVMD, REGOVMS, REGOVVA indicate whether the Respondent is covered by Medicare, Medicaid (at death or since previous interview), VA or CHAMPUS.

From Wave 3 on, the Medicaid question is asked in two parts. The first question is whether the Respondent was covered by Medicaid at any time since the previous interview. REGOVMS is coded to 0/1 for No/Yes. The proxy is then asked if the Respondent was covered by Medicaid at the time of death. REGOVMD is coded to 0/1 for No/Yes as well. If REGOVMS is missing, don't know or refused, then REGOVMD is assigned the same.

From Wave 4 forward, separate questions are asked about the various types of government health insurance. In Waves 2H and 3, a question was asked about other government insurance, including CHAMPUS and CHAMP-VA, or other military programs. From Wave 4 forward, only CHAMPUS / CHAMP-VA, and, in 2002, TRI-CARE, are mentioned. REGOVMR, REGOVMD, REGOVMS, and REGOVVA are derived from these questions.

In Wave 2H, the interviewer asks if the Respondent was covered by any government health insurance. REHIGOV is simply recoded to 0/1 for No/Yes and for missing values from this question.

A separate response for "Other government insurance" is used in Wave 3 to construct REHIGOV. If the Respondent indicates that they were covered by any of these types of insurance, then REHIGOV is set to yes (=1). If the proxy indicates the Respondent had no government insurance coverage, then REHIGOV is set to no (=0). Otherwise, REHIGOV is set to a missing value based on missing values in the raw data.

### **Core and Exit Differences**

There are two variables for Medicaid coverage constructed from the Exit raw data. REGOVMD, Respondent had Medicaid at time of death and REGOVMS, Respondent had Medicaid any time since previous interview. The set of variables for Medicaid coverage constructed from the Core Interview measures, RwGOVMD, refers to the Respondent having Medicaid at the time of interview.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

In Wave 1, the health insurance questions are asked only of the Financial Respondent, about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only.

In Waves 1 and 2H, the government insurance questions begin by asking: "Are you currently covered by any federal government health insurance programs, such as Medicare, Medicaid, or CHAMPUS, VA, or other military programs?" A subsequent question asks: "Which program is that?" and multiple answers are allowed. Separate variables code responses of Medicare, Medicaid, VA/Champus, and Other (including Bureau of Indian Affairs). In Wave 2H responses also include mail handlers insurance, federal employees health insurance, Blue Cross/Blue Shield, local or state government health plan, and HMO. Up to four responses are reported.

In Wave 2A and from Wave 3 forward, questions are asked separately about Medicare, Medicaid, and CHAMPUS/CHAMP-VA

or other government health insurance coverage, with a few variations. In all of these waves the Medicare question is: "Are you currently covered by Medicare health insurance?"

In Wave 2A the Medicaid question is: "Is your health care currently covered by Medicaid?" From Wave 3 forward, the Medicaid questions are: 1) "Have you been covered by Medicaid health insurance at any time (since previous wave interview/in last 2 years)?" and if yes, 2) "Are you currently covered by Medicaid?"

In Waves 2A and 3A, the CHAMPUS and other government health insurance questions are: 1) "Are you currently covered by any other government health insurance programs, such as Railroad Retirement, CHAMPUS, CHAMP-VA, or any other military health programs?" and if yes, 2) "Which program is that?"

In Waves 3H, 4 and 5, the question is: "Are you currently covered by CHAMPUS, CHAMP-VA, or any other military health care plan?" In Wave 6, a new name called TRI\_CARE is added that includes what used to be known as CHAMPUS and CHAMP-VA. The question is: "Are you currently covered by TRI\_CARE, CHAMPUS, CHAMP-VA or any other military health care plan?" Prior to Wave 6, TRICARE, which replaces CHAMPUS for active and retired military, and is separate from CHAMP-VA, was not included in the question wording. There were also restrictions on coverage by TRICARE when over 65 and covered by Medicare until 2001.

## Exit Interview Variables

In Wave 2H, the question asks if the Respondent is covered by any government health insurance. REHIGOV is simply recoded to 0/1 for No/Yes and for missing values from this question. Wave 3 forward constructs the REHIGOV from the separate government insurance questions.

In Wave 4 forward separate questions are asked about the various types of government health insurance. In Waves 2H and 3, a question was asked about other government insurance, including CHAMPUS and CHAMP-VA, or other military programs. From Wave 4 forward, only CHAMPUS / CHAMP-VA, and, in 2002, TRI-CARE, are mentioned. REGOVMR, REGOVMD, REGOVVA are derived from these questions.

From Wave 3 on, REGOVMS is constructed from the Medicaid question at any time since last interview; REGOVMSD is constructed from the question about Medicaid at time of death. In Wave 2H, there is only one question asked, therefore REGOVMS and REGOVMSD are both assigned the same code.

## How Constructed

### Core Interview Variables

RwMRPREM indicates the amount in nominal dollars that the Respondent pays monthly for a Medicare/Medicaid HMO insurance plan. SwMRPREM provides the information for the Respondent's spouse or partner.

The Respondent is asked, "Are you currently covered by Medicare health insurance?" and is later asked, "Are you currently covered by (Medicaid/State name for Medicaid)?" If a Respondent indicates having coverage provided through either Medicare or Medicaid, a follow-up question asks if their Medicare/Medicaid is provided through an HMO: "Do you receive your [Medicare/Medicaid/State name for MEDICAID] benefits through [an HMO/a Medicare Advantage Plan, sometimes called a Medicare HMO], that is a Health Maintenance Organization?"

If the Respondent says that their Medicare/Medicaid coverage is provided through an HMO, they are asked, "How much do you, yourself, pay in premiums for this plan?"

The Respondent reports the amount paid as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts.

If the Respondent does not report having Medicare/Medicaid through an HMO, then RwMRPREM is set to .N to indicate no HMO Medicare/Medicaid health insurance plan.

In Wave 11, due to a survey instrument glitch, only individuals covered by Medicaid and not Medicare were asked the premium questions. This results in a large number of .M=missing values for Wave 11.

### Exit Interview Variables

REMRPREM indicates the amount in nominal dollars that the Respondent paid monthly for a Medicare/Medicaid HMO insurance plan prior to death.

If the proxy says the Respondent's Medicare/Medicaid coverage is provided through an HMO, they are asked, "Not including co-pays or deductions from Social Security, how much did they pay in premiums for this plan?"

The amount paid is reported as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts. If the Respondent does not have Medicare/Medicaid through an HMO, then REMRPREM is set to .N to indicate no HMO Medicare/Medicaid health insurance plan.

### Core and Exit Differences

In the Exit Interview, the questions on premium amounts are not asked in Waves 2H and 3A. In the Core Interview, the questions are not asked in Waves 1 and 2.

## Cross Wave Differences in Original HRS Data

### Core Interview Variables

The questions on premium amounts are not asked in Waves 1 and 2.

The wording in the question asking for premium amounts varies by wave. In Wave 3A the question asks, "About how much are your premiums for this plan?"

In Wave 3H the premium amount question is worded as, "Not including deductions from your Social Security, how much do you pay for this plan?" In Waves 4 to 9, the premium amount question asks, "Not including co-pays or deductions from your Social Security, how much do you, yourself, pay for this plan?"

In Wave 10, Respondents are first asked the method used to pay their premiums. The question asks, "Some people who have Medicare Advantage pay for their coverage with a deduction from their Social Security checks. Some pay directly to the insurance company. How do you pay for yours?" If the Respondent indicates that payment is paid directly, they are asked the general premium amount questions (see below). If the Respondent indicates that payment deducted from Social Security or that they pay nothing, R10MRPREM is set to 0. Note that there is a follow up question asking amount deducted from Social Security if the Respondent indicates payment through deductions. However, to keep the variable consistent with other waves, this value is not included in R10MRPREM.

Beginning in Wave 10, the premium amount question varies depending on if the individual is covered by Medicare or Medicaid. If the Respondent is covered by a Medicare HMO/Medicare Advantage, the wording is, "How much do you, yourself, pay in premiums for this plan?" If the Respondent is not covered by Medicare, the question asks, "Not including co-pays or deductions from your Social Security, how much do you, yourself, pay for this plan?"

In Wave 11, due to a survey instrument glitch, only individuals covered by Medicaid and not Medicare were asked the premium questions. This results in a large number of .M=missing values for Wave 11.

### Exit Interview Variables

The wording in the question asking for premium amounts varies by wave. In Wave 3H the question asks, "About how much are your premiums for this plan?"

From Wave 4 forward, the premium amount question is worded as, "Not including deductions from your Social Security, how much do you pay for this plan?" In Waves 4 to 9, the premium amount question asks, "Not including co-pays or deductions from your Social Security, much did [he/she], [himself/herself], pay in premiums for this plan?"

### How Constructed

RwRXPREM indicates the amount in nominal dollars that the Respondent pays monthly for a Medicare prescription drug plan. SwRXPREM provides the information for the Respondent's spouse or partner. The question is first asked in Wave 8, shortly after Medicare Part D was established in 2006.

If a Respondent indicates that they have Medicare coverage, they are first asked to establish whether Medicare coverage is provided through Original Medicare or a Medicare HMO (also referred to as Medicare Part C or Medicare Advantage). If a Respondent indicates that they are not covered by a Medicare HMO plan that includes prescription drug coverage, they are asked if they have registered for Medicare Part D, which covers prescription drugs. If the Respondent indicates participating in a Part D plan, they are asked, "How much do you, yourself, pay per month in premiums for this plan?" This amount is coded in RwRXPREM.

If the Respondent indicates that the prescription drug insurance premium is covered through a Medicare HMO or a private plan, RWRXPREM is set to .C. If the Respondent does not have prescription drug coverage through Medicare, RWRXPREM is set to .N.

### Cross Wave Differences in Original HRS Data

The questions about prescription drug coverage premiums are not asked in Waves 1-7.

The questions about prescription drug coverage premiums are first asked in Wave 8, shortly after Medicare Part D was established in 2006. The wording of the question asking Respondents if they have registered for Part D is different in Wave 8. The Respondent is asked, "Beginning in 2006, Part D of Medicare provides coverage for prescription drugs. Did you sign up to receive Medicare prescription drug coverage in 2006?"

Beginning in Wave 9, the question is worded, "Part D of Medicare provides coverage for prescription drugs, usually through a private insurance provider. Are you enrolled in Medicare Part D, also known as the Medicare Prescription Drug Plan?"

In Waves 9 and 10, before establishing premium amounts, Respondents are first asked the method used to pay their premiums. The question asks: "Many Medicare beneficiaries pay the premium for their Medicare drug coverage through their Social Security checks. Some pay directly to the provider. How do you pay for yours?" If the Respondent's premium is deducted from Social Security, a follow-up question asks: "How much is your Social Security deduction per month for your Part D plan?" Otherwise, Respondents are asked the standard premium question, "How much do you, yourself, pay per month in premiums for this plan?"

From Wave 11 forward, Respondents are no longer asked about the method used to pay their premiums. They are simply asked how much they pay in premiums.

## General Comments

Private health insurance plans encompass all plans purchased on the private market, including coverage purchased through an employer, the individual insurance marketplaces, a union, or a trade association. Previous versions of the RAND HRS Longitudinal File have included variables that describe private plans solely provided by current or former employers, and these variables are still provided for continuity purposes. RwPRPCNT is similar, but not identical, to RwhENUM. For Waves 1-5, RwhENUM is a count of employer-provided health insurance plans only, whereas RwPRPCNT is a count of all private health insurance plans, except long-term care insurance. From Wave 6 forward, RwPRPCNT and RwhENUM are the same, and both are a count of all private health insurance plans, except long-term care insurance. Please see the Number of employer-provided/private health insurance plans section for a full description of RwhENUM.

## How Constructed

### Core Interview Variables

RwPRPCNT is a count of the number of private health insurance plans the Respondent reports. SwPRPCNT provides the information for the Respondent's spouse or partner. This count does not include long-term care insurance.

In Waves 1 to 5, RwPRPCNT is the sum of the answers to questions which ask about different types of private insurance plans (self-employed, employer-provided, supplemental, and those purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

Beginning in Wave 6, the number of private health insurance plans is asked in one question and RwPRPCNT is simply the number of plans reported by the Respondent.

SwPRPCNT for Wave 1 is taken from the Financial Respondent's information as appropriate. That is, if the Respondent is the Financial Respondent, then S1PRPCNT contains the Financial Respondent's spouse's information. If the Respondent is the spouse of the Financial Respondent, then S1PRPCNT contains the Financial Respondent's information.

From Wave 2 forward, SwPRPCNT is populated using the spouse's self-reported value for RwPRPCNT, where available. If the Respondent is not married, SwPRPCNT is set to .U=unmarried. If the Respondent's spouse did not respond, then SwPRPCNT is set to .V=Spouse is non-response.

### Exit Interview Variables

REPRPCNT is a count of the number of private health insurance plans the Respondent had at time of death. This count does not include long-term care insurance.

In Waves 2H to 5, REPRPCNT is the sum of the answers to questions which ask about different types of private insurance

plans (self-employed, employer-provided, supplemental, and those purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

Beginning in Wave 6, the number of private health insurance plans is asked in one question and REPRCNT is simply the number of plans reported by the proxy.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

In Wave 1, the health insurance questions are asked only of the Financial Respondent about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 forward, health insurance questions are asked of individual Respondents about their own coverage only.

In Waves 1 to 5, RwPRCNT is the sum of the answers to questions which individually ask about the different types of private insurance plans (self-employed, employer-provided, supplemental, and those purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

In Wave 1, if a Financial Respondent indicates that they or their spouse have employer-provided insurance, they are asked how many plans they or their spouse have.

The Respondent is then asked if they or their spouse have any other type of private health insurance and to list the types. The number of plans added from this question is based on the number of types of coverage listed, not including government-sourced plans or long-term care insurance. If a Respondent indicates that they have other insurance but does not list a type, this is counted as one private plan.

In Wave 2A, the Respondent is asked about all private plans in one question, "How many different policies do you have (in addition to Medicare)?" In a separate question, Respondents are asked "What kind of coverage do you have?" Since this list includes long-term care insurance, if a Respondent only lists long-term care insurance as the type of coverage they have, then the count is adjusted to "0". Otherwise, the count is the number of policies they list in the private plan question.

In Wave 2H, the Respondent is asked separately about employer-provided insurance, supplemental insurance, and insurance purchased directly from an insurance company or group.

For employer-provided insurance, if the Respondent previously reported having employer-provided health insurance in Wave 1, then a question asks if they are still covered by the same plan. If the response is yes, this is counted as one private plan. If the Respondent does not confirm having the same health insurance as in Wave 1, a separate question asks how many employer-provided plans they have.

The Respondent is then asked if they purchase any coverage directly from an insurance company or organization. If the Respondent says yes, this is counted as one private plan.

Then the Respondent is asked about supplemental insurance. If the Respondent indicates having supplemental insurance, they are asked what type of supplemental coverage they have. The number of plans added from this question is based on the number of types of supplemental coverage they list, not including government-sourced plans or long-term care insurance. If a Respondent indicates having supplemental insurance but does not list a type, this is counted as one private plan.

In Wave 3A, the Respondent is asked, not including long-term care insurance, Medicare/Medicaid, or government health insurance, "How many other health plans do you currently have?"

In Waves 3H, 4, and 5, the Respondent is asked separately about self-employed insurance, employer-provided insurance, supplemental insurance, and insurance purchased directly from an insurance company or group. In Wave 3H, self-employed individuals are simply asked the employer-provided insurance question.

In Waves 4 and 5, if the Respondent is self-employed, they are asked, "You mentioned earlier that you were self-employed. Do you have health insurance through that business that pays hospital bills?" If the Respondent says yes, this is counted as one private plan.

In Wave 3H, all are asked about employer-provided insurance. In Waves 4 and 5, if a Respondent is not self-employed or does not have insurance through their own business, then they are asked, "(Not including Medicare/(Medicaid/STATE NAME FOR MEDICAID) /CHAMPUS/CHAMP-VA) are you covered by any employer-provided health insurance, through either (a/your or your spouse's/your or your partner's) current or past employer?" and if the Respondent says yes, they are asked, "How many different employer-provided health insurance plans are you covered by?"

If a Respondent is covered by Medicare or Medicaid, they are asked if they have a supplemental plan: "Not counting long-term care insurance or Medicare or any other insurance we've discussed, do you have any additional insurance that pays any part of hospital or doctor bills? Sometimes this is called a Medigap or Medicare Supplement policy." If the Respondent says yes, this is counted as one private plan.

If a Respondent is not covered by Medicare, they are asked about insurance purchased directly from an insurance company or group: "Not counting long-term care policies or the health insurance you already told me about, do you have any other health insurance coverage that you purchased directly from an insurance company or through a membership organization?" If the Respondent says yes, this is counted as one private plan.

Beginning in Wave 6, the number of private insurance plans a Respondent has is asked in one question. The question is prefaced with the following: "Now, we'd like to ask about all the other types of health insurance plans you might have, such as insurance through an employer or a business, coverage for retirees, or health insurance you buy for yourself, including any (Medigap or) other supplemental coverage." The Respondent is then asked, "Do NOT include long-term care insurance. [Other than your Medicare HMO you've just told me about/anything you have just told me about,] how many other such plans do you have?"

### Exit Interview Variables

In Waves 2H to 5, REPRCNT is the sum of the answers to questions which individually ask about the different types of private insurance plans (self-employed, employer-provided, supplemental, and those purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

In Wave 2H, the proxy is asked separately about the Respondent's employer-provided insurance, supplemental insurance, and insurance purchased directly from an insurance company or group.

For employer-provided insurance, if the Respondent previously reported having employer-provided health insurance in Wave 1, then a question asks if they were still covered by the same plan. If the response is yes, this is counted as one private plan. If the proxy does not confirm having the same health insurance as in Wave 1, a separate question asks how many employer-provided plans the Respondent had.

The proxy is then asked if the Respondent purchased any coverage directly from an insurance company or organization. If the Respondent did, this is counted as one private plan.

## How Constructed

### Core Interview Variables

RwPRPRM1, RwPRPRM2, and RwPRPRM3 indicate the amount in nominal dollars that the Respondent pays in monthly premiums for their private health insurance plan(s). SwPRPRM1, SwPRPRM2, and SwPRPRM3 provide the information for the Respondent's spouse or partner.

In Waves 1 to 5, Respondents are asked about their private health insurance plan premiums by type of plan (employer-provided, supplemental, purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

From Wave 6 forward, Respondents are asked about their three most important private health insurance plans.

In Wave 3A and Waves 6 to 11, if a Respondent indicates having a private health insurance plan, they are asked if they pay all/some/none of the costs of the premium.

In Waves 2H, 3H, 4, and 5, if a Respondent indicates that they have a private employer-provided health insurance plan, they are asked if they pay all/some/none of the costs of the premium.

In Waves 3H, 4, and 5, if a Respondent indicates that they have a private supplemental health insurance plan, they are asked if they pay all/some/none of the costs of the premium.

In all waves, if the Respondent indicates that they pay all or some of the cost of the premium or there is no initial question about how much of the premium the Respondent pays, the Respondent is asked how much they pay for this insurance.

The Respondent reports amount paid as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts.

RwPRPRM<sub>x</sub>, where "x" is the relevant plan number, is set to .S when the premium question is skipped. The question(s) may be skipped for a variety of reasons, including: no (more) private health insurance plans, the Respondent does not know or refuses to answer the number of private health insurance plans question, or the question was not asked for a specific type of private health plan.

SwPRPRM1 for Wave 1 is taken from the Financial Respondent's information if appropriate. That is, if the Respondent is the Financial Respondent, then S1PRPRM1 contains the Financial Respondent's spouse's information. If the Respondent is the spouse of the Financial Respondent, then S1PRPRM1 contains the Financial Respondent's information.

From Wave 2 forward, this information is taken from the spouse's self-reported RwPRPRM1-3 variables, if available. If the Respondent is not married, SwPRPRM1-3 is set to .U=unmarried. If the Respondent's spouse did not respond, then SwPRPRM1-3 is set to .V=Spouse is non-response.

Users should note that if summing total household insurance plan premium amounts, that double counting can occur since insurance plans can cover both the Respondent and their spouse. Please refer to the RwPRSRC1-3 variables documented in the "Source of private health insurance plans" section and consider using these variables in creating a total household insurance plan premium amount value.

### Exit Interview Variables

REPRPRM1, REPRPRM2, and REPRPRM3 indicate the amount in nominal dollars that the Respondent paid in monthly premiums for their private health insurance plan(s) at time of death.

In Waves 2H to 5, the proxy is asked about the Respondent's private health insurance plan premiums by type of plan (employer-provided, supplemental, purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

From Wave 6 forward, the proxy is asked about the Respondent's three most important private health insurance plans.

In Wave 3A and Waves 6 to 11, if a proxy indicates the Respondent had a private health insurance plan, they are asked if they pay all/some/none of the costs of the premium.

In Waves 2H, 3H, 4, and 5, if a proxy indicates that the Respondent had a private employer-provided health insurance plan, they are asked if the Respondent paid all/some/none of the costs of the premium.

In Waves 3H, 4, and 5, if a proxy indicates that the Respondent had a private supplemental health insurance plan, they are asked if the Respondent paid all/some/none of the costs of the premium.

In all waves, if the proxy indicates that the Respondent paid all or some of the cost of the premium or if there is no initial question about how much of the premium the Respondent paid, the proxy is asked how much the Respondent paid for that insurance.

The proxy reports amount paid as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts.

REPRPRM1 is set to .X if the proxy reports that the Respondent owned 0 private health plans. Similarly, REPRPRM2 is set to .X if the proxy reports 0-1 private health plans, and REPRPRM3 is set to .X if the proxy reports 0-2 private health plans.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

In Wave 1, the health insurance questions are asked only of the Financial Respondent about the Financial Respondent's insurance coverage and, if married, their spouse's insurance coverage. From Wave 2 forward, health insurance questions are asked of individual Respondents about their own coverage only.

In Wave 1, the Respondent only reports premiums for their supplemental plans or plans purchased directly from an insurance company or group. However, this can include long-term care insurance. The question asks, "How much do you pay for this insurance?" and it is unclear if the Respondent responds for all supplemental/other plans or just the most important plan. In a separate question, the Respondent lists the types of private health insurance plans they have (other than employer-provided plans). If the Respondent only reports a long-term care insurance plan, then R1PRPRM1 is set to .L to indicate that the premium amount is only for a long-term care insurance plan. In this instance, the premium amount is recorded in R1LTCPRM. If a Respondent lists long-term care and another type of insurance (such as Medigap), these both may be part of the premium listed in R1PRPRM1. There are no questions about the second or third supplemental plan or about employer-provided insurance premiums in Wave 1.

In Wave 2A, the Respondent reports premiums for all private plans in one question which asks, "Again, not counting Medicare, how much do you pay for this policy/Taken together, how much do you pay for these policies?" Note therefore that if the Respondent has reported multiple private health insurance plans, the sum of the premiums is reported in R2PRPRM1. In a separate question, Respondents are asked "What kind of coverage do you have?" Since this list includes long-term care insurance, if a Respondent only lists long-term care insurance as the type of coverage they have, then R2PRPRM1 is set to .L to indicate that the premium amount is only for a long-term care insurance plan. In this instance, the premium amount is recorded in R2LTCPRM. Since all private health insurance plan premiums are reported in one location, there are no premium variables for the second or third plans in Wave 2A.

In Wave 2H, the Respondent is asked about employer-provided plans, other/supplemental plans, and plans direct from an insurance company or group separately.

For the employer-provided plans in Wave 2H, the amount of the premium is not asked if (1) a preloaded value indicates that the Respondent reported being covered by employer-provided health insurance at Wave 1, and (2) if the Respondent indicates that they are still covered by that source. In this instance, R2PRPRM1 is set to .C to indicate that the Respondent has a plan, but the premium amount is not available. Otherwise, Respondents who indicate having employer-provided plans are asked, "About how much per month do you

pay under this plan?"

In Wave 2H, the Respondent is asked about plans purchased directly from an insurance company or group. If the Respondent indicates having such coverage, they are asked, "How much do you pay for this insurance (per month or quarter)?"

In Wave 2H, the Respondent is then asked about supplemental plans. If the Respondent indicates having a supplemental plan, they are asked "What kind of coverage do you have?" Since this list includes long-term care insurance, if a Respondent only lists long-term care insurance as the type of coverage they have, then R2PRPRM1 is set to .L to indicate that the premium amount is only for a long-term care insurance plan. In this instance, the premium amount is recorded in R2LTCPRM. After indicating the type of plan, the Respondent is then asked, "How much do you pay for this insurance?"

In Wave 3A, if the Respondent indicates having one private health insurance plan, they are asked about that plan. If the Respondent indicates having more than one private health insurance plan, they are asked about the first plan first, then about all other plans combined. For each round, the Respondent is asked, "How is this coverage paid for—entirely by you (or your husband/or your wife/or your partner), entirely by your (husband's/wife's/partner's) (former) employer or union, or partly by a (former) employer or union, or what?" If the Respondent indicates that the plan is entirely paid for by an employer or union, then the premium amount is coded as "0". Otherwise, the Respondent is asked, "About how much do you pay for this plan?"

In Wave 3A, there was an erroneous skip pattern that affected 1,172 Respondents. If the Respondent listed one private plan, the follow-up questions on source and premium amount were skipped. At some point, this issue was fixed but 1,172 Respondents were affected. For these individuals, the premium variable is coded as .M for other missing.

In Waves 3H, 4, and 5, the Respondent is asked about employer-provided plans, other/supplemental plans, and plans purchased directly from an insurance company or group separately.

In Waves 3H and 4, for employer-provided plans, if a Respondent indicates having an employer-provided plan or a plan through self-employment, then they are first asked, "Do you pay all of the costs, some of the costs, or none of the costs of the premium for this health insurance coverage?" If the Respondent indicates that they pay none of the cost, then the premium amount is coded as "0". Otherwise, the Respondent is asked, "How much do you pay for this health insurance?"

In Wave 5, employer-provided plan questions are similar to Waves 3H and 4, with a few exceptions. Those who indicate having a plan through self-employment and ARE covered by Medicare are not asked the premium or source questions. Those who indicate having a plan through self-employment and ARE NOT covered by Medicare are asked the premium and source questions in a separate question, the same question for those who obtain insurance direct from an insurance company or group. If the Respondent obtains health insurance through their spouse, then the premium amount question is not asked and the premium variable is coded as .C to indicate coverage by spouse.

In Waves 4 and 5, for employer-provided plans, if the Respondent does not list the time period for amount paid (e.g., bi-weekly, monthly), then the monthly amount cannot be calculated and RwPRPRMx, where 'x' is the relevant plan number, is set to .K.

In Waves 3H, 4, and 5, the Respondent is then asked about supplemental plans. If the Respondent indicates having a supplemental private health plan, they are asked if they pay some/all/none of the costs. If the Respondent pays none of the cost, then the premium amount is coded as "0", otherwise the Respondent is asked how much they pay. The Respondent is then asked about plans direct from an insurance company or group. If the Respondent indicates coverage, the questions are similar to the supplemental plan questions. Note that in Wave 5, the premiums for those who have a plan through self-employment and ARE NOT covered by Medicare are obtained in this group of questions.

From Wave 6 forward, Respondents are asked about their three most important private health insurance plans.

In Waves 6 to 11, if a Respondent indicates having one or more private plans, a question asks, "Including any help from your family, do you [or your husband/wife/partner] pay all of the costs, some of the costs, or none of the costs of the premium for this health insurance coverage?" If the Respondent indicates that they pay none of the cost, then the premium amount is coded as "0". Otherwise, the Respondent is next asked, "How much do you [or your] [husband/wife/partner] pay per month in premiums for this plan?"

From Wave 12 forward, the Respondent is not asked what portion of the premium they pay. The Respondent is simply asked, "How much do you [or your] [husband/wife/partner] pay per month in premiums for this plan (for you and any members of your household that are also covered)?"

### Exit Interview Variables

In Wave 2H, the proxy is asked about employer-provided plans, other/supplemental plans, and plans direct from an insurance company or group separately.

For the employer-provided plans in Wave 2H, the amount of the premium is not asked if (1) a preloaded value indicates that the Respondent reported being covered by employer-provided health insurance at Wave 1, and (2) if the proxy indicates that the Respondent was still covered by that source. In this instance, REPRPRM1 is set to .C to indicate that the Respondent had a plan, but the premium amount is not available. Otherwise, proxies for Respondents who had employer-provided plans are asked, "About how much per month do you pay under this plan?" Note that in Wave 2H, there is no separately worded survey for the proxy.

In Wave 2H, the proxy is asked about plans purchased directly from an insurance company or group. If the Respondent had such coverage, the proxy is asked, "How much do you pay for this insurance (per month or quarter)?"

In Wave 2H, the proxy is then asked about supplemental plans. If the Respondent had a supplemental plan, the proxy is asked "What kind of coverage do you have?" Since this list includes long-term care insurance, if a proxy only lists long-term care insurance as the type of coverage the Respondent had, then REPRPRM1 is set to .L to indicate that the premium amount is only for a long-term care insurance plan. In this instance, the premium amount is recorded in RELTCPRM. After indicating the type of plan, the proxy is then asked, "How much do you pay for this insurance?"

In Wave 3A, if the proxy indicates the Respondent had one private health insurance plan, they are asked about that plan. If the Respondent had more than one private health insurance plan, the proxy is asked about the first plan first, then about all other plans combined. For each round, the proxy is asked, "How was this coverage paid for—entirely by (him/her) (or his/her husband/or his/her wife/or his/her partner/...), entirely by (his/her) (husband's/wife's/partner's/...) (former) employer or union, or partly by a (former) employer or union, or what?" If the proxy indicates that the plan was entirely paid for by an employer or union, then the premium amount is coded as "0." Otherwise, the proxy is asked, "About how much were (his/her) premiums for this plan?"

In Waves 3H, 4, and 5, the proxy is asked about employer-provided plans, other/supplemental plans, and plans purchased directly from an insurance company or group separately.

In Waves 3H and 4, for employer-provided plans, if a Respondent had an employer-provided plan or a plan through self-employment, then the proxy is first asked, "Did (he/she) or you pay all of the costs, some of the costs, or none of the costs of the premium for this health insurance coverage?" If the Respondent indicates that they paid none of the cost, then the premium amount is coded as "0." Otherwise, the Respondent is asked, "How much was (he/she) paying for this health insurance coverage?"

In Wave 5, employer-provided plan questions are similar to Waves 3H and 4, with a few exceptions. Those who had a plan through self-employment and were covered by Medicare are not asked the premium or source questions. Those who had a plan through self-employment and were not covered by Medicare are asked the premium and source questions in a separate question, the same question for those who obtain insurance directly from an insurance company or group. If the Respondent obtained health insurance through their spouse, then the premium amount question is not asked, and the premium variable is coded as .C to indicate coverage by spouse.

In Waves 4 and 5, for employer-provided plans, if the proxy does not list the time period for amount paid (e.g., bi-weekly, monthly), then the monthly amount cannot be calculated and REPRPRMx, where 'x' is the relevant plan number, is set to .K.

In Waves 3H, 4, and 5, the proxy is then asked about supplemental plans. If the Respondent had a supplemental private health plan, the proxy is asked if the Respondent paid some/all/none of the costs. If the Respondent paid none of the cost, then the premium amount is coded as "0," otherwise the proxy is asked how much the Respondent paid. The proxy is then asked about direct plans from an insurance company or group. If the Respondent had coverage, the questions are similar to the supplemental plan questions. Note that

in Wave 5, the premiums for those who have a plan through self-employment and ARE NOT covered by Medicare are obtained in this group of questions.

From Wave 6 forward, the proxy is asked about the Respondent's three most important private health insurance plans.

In Waves 6 to 11, if a Respondent had one or more private plans, a question asks, "Including any help from [her/his] family, did [she/he] [or/or her/his] [you/husband/wife/partner] pay all of the costs, some of the costs, or none of the costs of the premium for this health insurance coverage?" If the Respondent paid none of the cost, then the premium amount is coded as "0." Otherwise, the proxy is next asked, "How much did [he/she] [you or your] [husband/wife/partner] pay per month in premiums for this plan for [him/her/self] and any members of [his/her] household that were also covered?"

From Wave 12 forward, the proxy is not asked what portion of the premium the Respondent paid. The proxy is simply asked, "How much did [he/she] (or [you/[his/her] [husband/wife/partner]]) pay per month in premiums for this plan for [himself/herself] and any members of [his/her] household that were also covered?"

## How Constructed

### Core Interview Variables

RwPRSRC1, RwPRSRC2, and RwPRSRC3 indicate the source of the Respondent's private health insurance plan(s). These correspond with the plan listed in premium variables RwPRPRM1, RwPRPRM2, and RwPRPRM3. SwPRSRC1, SwPRSRC2, and SwPRSRC3 provide the information for the Respondent's spouse or partner.

In Waves 1 to 5, Respondents are asked about their private health insurance plans by type of plan (employer-provided, supplemental, purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

In Wave 2H, for employer-provided health insurance, the source of the plan is not asked if (1) a preloaded value indicates that the Respondent reported being covered by employer-provided health insurance at Wave 1, and (2) if the Respondent indicates that they are still covered by that source. In this instance, source is coded from the Respondent's Wave 1 answers.

From Wave 6 on, Respondents are asked about their three most important private health insurance plans. The source is ascertained through a series of questions.

### Exit Interview Variables

REPRSRC1, REPRSRC2, and REPRSRC3 indicate the source of the Respondent's private health insurance plan(s) at time of death. These correspond with the plans listed in premium variables REPRPRM1, REPRPRM2, and REPRPRM3.

In Waves 2H to 5, proxies are asked about the Respondent's private health insurance plans by type of plan (employer-provided, supplemental, purchased directly from an insurance company or group). The wording of these questions varies by wave and not all waves ask about all types separately.

In Wave 2H, for employer-provided health insurance, the source of the plan is not asked if (1) a preloaded value indicates that the Respondent reported being covered by employer-provided health insurance at Wave 1, and (2) if the proxy indicates that the Respondent was still covered by that source at time of death. In this instance, source is coded from the Respondent's Wave 1 answers.

From Wave 6 on, proxies are asked about the Respondent's three most important private health insurance plans. The source is ascertained through a series of questions.

## Cross Wave Differences in Original HRS Data

### Core Interview Variables

In Wave 1, the health insurance questions are asked only of the Financial Respondent about the Financial Respondent's insurance coverage and, if married, their spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only.

In Wave 1, Respondents are asked, "Do you have any type of health insurance coverage, Medigap or other supplemental coverage, or long-term care insurance that is purchased directly from an insurance company or through a membership organization such as AARP (the American Association of Retired Persons)?" If R1PRPRM1 is not equal to .S (skipped), then R1PRSRC1 is set to "Direct from Insurance Company/Group," since this is the only source where premium amount is asked. Since there are no questions about the second or third premium or about employer-provided insurance premiums, there are no second or third source variables in Wave 1.

In Wave 2A, questions about private health insurance do not include any information about the source of the coverage. So for the AHEAD Respondents, if R2PRPRM1 is not equal to .S (skipped) then R2PRSRC1 is set to .Q, to indicate the question was not asked.

In Wave 2H, the Respondent is asked about employer-provided plans, other/supplemental plans, and plans purchased directly from an insurance company or group separately.

In Wave 2H, if preloaded information indicates the Respondent was covered by any employer-provided health insurance in Wave 1, the following question is asked: "According to our records, in [Wave 1 interview month] you were covered by health insurance from [source of plan preloaded from W1]. Are you still covered by the same employer health insurance policy as before?" If yes, no further questions on source of insurance are asked and source is coded from the Respondent's Wave 1 answers.

If the Respondent is the Financial Respondent in Wave 2H and says the pre-loaded information is incorrect, a follow-up question asks for a corrected source of insurance at the last interview and whether the Respondent is still covered. If the Respondent was not the Financial Respondent in Wave 1 and says the pre-loaded information is incorrect, or if the Respondent (Financial Respondent or not) responds with any answer except "yes," the Respondent is asked, "Thinking about (this/the first/the second) plan, how is this coverage obtained?"

In Wave 2H, the Respondent is then asked separately about plans purchased directly from an insurance company or group and supplemental plans purchased directly from an insurance company or group. If the corresponding premium variable R2PRPRMx is not equal to .S (skipped), then R2PRSRCx is set to "Direct from Insurance Company/Group," where "x" indicates the plan number 1 through 3. The one exception is for Respondents who list a Government plan under the supplemental plan question. In this case, R2PRPRMx and R2PRSRCx are set to .G to indicate a Government (not private) health care plan.

In Wave 3A, if the Respondent indicates having one private health insurance plan, they are asked about that plan. If the Respondent indicates having more than one private health insurance plan, they are asked about the first plan first, then about all other plans combined. For each round, the Respondent is asked, "How did you obtain this type of health insurance coverage? Was it through your (or your husband's/or your wife's/or your partner's) employer or union, or through an organization or what?" Respondents can list up to three sources. The first source listed is coded as R3PRSRCx, where "x" indicates the plan number, 1 to 3.

In Wave 3A, there was an error in a skip pattern: if the Respondent listed one private plan, the follow-up questions on source and premium amount were skipped. This issue affected 1,172 Respondents before it was discovered and fixed. For these individuals, the premium variable is coded as .M for other missing.

In Waves 3H, 4, and 5, the Respondent is separately asked about employer-provided plans, other/supplemental plans, and plans purchased directly from an insurance company or group.

For employer-provided plans, if a Respondent indicates having an employer-provided plan, then they are asked, "Do you obtain this health insurance through your (or your husband/wife/partner's) current employer, former employer or union, or from someplace else?"

The Respondent is then asked about supplemental plans. The source for supplemental plans cannot be ascertained in Wave 3H and is coded as .K to indicate that the Respondent has a plan but the source is unknown. The Respondent is then asked about plans purchased directly from an insurance company or group. If the corresponding premium variable RwPRPRMx is not equal to .S (skipped), then RwPRSRCx is set to "Direct from Insurance Company/Group," where x indicates the plan number 1 through 3.

From Wave 6 forward, Respondents are asked about their three most important private health insurance plans. The source is ascertained through a series of questions. The Respondent is asked the questions in order until the source is ascertained. RwPRSRCx is coded based on the Respondent's answers to the source questions, where "x" indicates the plan number 1 through 3.

First, if the Respondent currently works for pay, they are asked, "Do you obtain this health insurance through your (own business or professional organization/current employer)?"

Next, the Respondent is asked, "Do you obtain this health insurance through a former employer of yours?" If the Respondent is married or partnered, the next set of questions ask, "Do you obtain this health insurance through your (husband/wife/partner)'s current employer?" and then, "Do you obtain this health insurance through your (husband/wife/partner)'s former employer?"

The final source question asks, "Did you purchase this plan directly from an insurance company, through your (or your (husband/wife/partner)'s/or your) union, through a group such as AARP, a church, or other organization, or what?" Some individuals list a federal, state, or military plan source for this question. In this case, the source variable is set to .G to indicate a Government (not private) health care plan.

In Wave 12, a new option to the final source question is added: "through an insurance exchange."

From Wave 13 forward, a preload lists the source of the plan the Respondent recorded during the last completed Core Interview. If the Respondent indicates that this is the same plan and source, the source is taken from the preload; however, in Wave 13 the preload fields were not all available so we use information from the last completed Core Interview.

Beginning in Wave 14, the sources for "6: Federal, State or Military programs" are grouped with "7. Other" in the raw HRS data, so the values that previously would be ".G=includes Gov't programs" in RwPRSRC1-3 are now valued as "10.Other".

## **Exit Interview Variables**

In Wave 2H, the proxy is asked about employer-provided plans, other/supplemental plans, and plans purchased directly from an insurance company or group separately.

In Wave 2H, if preloaded information indicates the Respondent was covered by any employer-provided health insurance in Wave 1, the following question is asked: "According to our records, in [Wave 1 interview month] you were covered by health insurance from [source of plan preloaded from W1]. Are you still covered by the same employer health insurance policy as before?" If yes, no further questions on source of insurance are asked and source is coded from the Respondent's Wave 1 answers. Note that in Wave 2H, there is no separately worded survey for the proxy.

In Wave 2H, the proxy is then asked separately about plans purchased directly from an insurance company or group and supplemental plans purchased directly from an insurance company or group. If the corresponding premium variable REPRPRMx is not equal to .S (skipped), then REPRSRCx is set to "Direct from Insurance Company/Group," where "x" indicates the plan number 1 through 3. The one exception is for Respondents who had a government plan under the supplemental plan question. In this case, REPRPRMx and REPRSRCx are set to .G to indicate a government (not private) health care plan.

In Wave 3A, if the Respondent had one private health insurance plan, the proxy is asked about that plan. If the Respondent had more than one private health insurance plan, the proxy is asked about the first plan first, then about all other plans combined. For each round, the proxy is asked, "How did (he/she) obtain this type of health insurance coverage? Was it through (his/her) (or his/her husband's/or his/her wife's/or his/her partner's/...) employer or union, or through an organization or what?" The proxy can list up to three sources. The first source listed is coded as REPRSRCx, where "x" indicates the plan number, 1 to 3.

In Waves 3H, 4, and 5, the proxy is separately asked about employer-provided plans, other/supplemental plans, and plans purchased directly from an insurance company or group.

For employer-provided plans, if a Respondent had an employer-provided plan, then the proxy is asked, "Was it through (his/her) (or his/her husband's/or his/her wife's/or his/her partner's/...) employer or union, or through an organization or what?"

The proxy is then asked about supplemental plans. The source for supplemental plans cannot be ascertained in Wave 4 and is coded as .K to indicate that the Respondent had a plan but the source is unknown. The proxy is then asked about plans purchased directly from an insurance company or group. If the corresponding premium variable REPRPRMx is not equal to .S (skipped), then REPRSRCx is set to "Direct from Insurance Company/Group," where x indicates the plan number 1 through 3.

From Wave 6 forward, the proxy is asked about the Respondent's three most important private health insurance plans at time of death. The source is ascertained through a series of questions. The proxy is asked the questions in order until the source is ascertained. REPRSRCx is coded based on the proxy's answers to the source questions, where "x" indicates the plan number 1 through 3.

First, if the Respondent worked for pay, the proxy is asked, "Did [she/he] obtain this health insurance through [her/his] own business or an employer?"

Next, the proxy is asked, "Did [he/she] obtain this health insurance through a former employer of [his/hers]?" If the Respondent was married or partnered, the next set of questions ask, "Did [he/she] obtain this health insurance through [your/[his/her former] [husband's/wife's/partner's]] current employer?" and then, "Did [he/she] obtain this health insurance through [your/[his/her former] [husband's/wife's/partner's]] former employer?"

The final source question asks, "Did [she/he] purchase this plan directly from an insurance company, through [her/his /husband/wife/partner's] union, through a group such as AARP, a church, or other organization, or what?" Some proxies list a federal, state, or military plan source for this question. In this case, the source variable is set to .G to indicate a government (not private) health care plan.

Beginning in Wave 12, a new option to the final source question is added: "through an insurance exchange." This option was not available in prior waves.

## How Constructed

### Core Interview Variables

RwCOVR indicates whether the Respondent is covered by health insurance from their current or previous employer. SwCOVR indicates whether the Respondent's spouse or partner is covered by the Respondent's employer. RwCOVS indicates whether the Respondent is covered by their spouse's employer. SwCOVS indicates whether the Respondent's spouse is covered by the spouse's employer.

If the Respondent says they are covered by employer-provided health insurance, then the source of that insurance is checked. If the source of any plan that covers the Respondent is the Respondent's current or previous employer, the Respondent's union, or through the Respondent's self-employment then RwCOVR is set to "yes." If the source of any plan that covers the Respondent is the spouse's current or previous employer or the spouse's union, then RwCOVS is set to "yes."

In Wave 1, the Financial Respondent answers all questions. These are adjusted as appropriate for the non-Financial Respondent. The source of insurance in this wave could be given as other, including deceased or ex-spouse. Because of the ambiguity of this code, if this is the only information available, RwCOVR and RwCOVS are set to .T, covered by other insurance including the possibility of an ex-spouse. In Versions prior to G, these cases were treated as missing source of coverage (.C).

In Wave 2H, the source of the plan is not asked if a preloaded value indicates that the Respondent reported being covered by employer-provided health insurance at Wave 1 and if the Respondent indicates that they are still covered by that source. The HRS documentation indicates that the preloaded value is taken from specific Wave 1 variables. In these cases, the Wave 1 variable is used to determine whether the plan that continues to cover the Respondent in Wave 2 is the Respondent's or the spouse's plan. If it is the Respondent's plan, then RwCOVR is set to "yes." If it is the spouse's plan, then RwCOVS is set to "yes."

If the preloaded value does not indicate Wave 1 coverage or if the Respondent does not say they are still covered by that source, then questions similar to the Wave 1 questions are asked, and if the source of any plan that covers the Respondent is the Respondent's current or previous employer, union, or own business, then RwCOVR is set to "yes." If the source of any plan that covers the Respondent is the spouse's current or previous employer, or union, then RwCOVS is set to "yes."

In Wave 2A, questions about non-government health insurance do not include any information about the source of the coverage. So for the AHEAD Respondents, R2COVR, R2COVS, and R2COVRT are set to .Q, to indicate that no information is available.

From Wave 3 forward, the questions do not depend on answers given in previous waves. In Wave 3A, a question asks if the Respondent is covered by any non-government health plan besides long-term care insurance. If any source of insurance is unknown, and none of the sources indicate the Respondent's employer, then RwCOVR is set to .E, which means the Respondent is covered by health insurance, but it is unknown whether the source is an employer. Similarly, if any source is unknown, and none are the Respondent's spouse's employer RwCOVS is set to special missing code .E. Note that there were a large number of cases that skipped the questions about source of insurance, but had indicated that they had some insurance, and are now assigned .E. If no source is unknown, and

none of the sources indicate the Respondent and the Respondent's spouse's employer, then RwCOVR and RwCOVS are set to "no," respectively.

In Waves 3H, 4 and 5, a question asks if the Respondent is covered by any employer-provided health insurance, or if self-employed, through the business. If no health insurance is reported in these questions, RwCOVR and RwCOVS are set to "no." If the Respondent reports having health insurance, the source-of-insurance questions are checked and RwCOVR is set to "yes" if the source is the Respondent's current or previous employer, or union. If the Respondent is self-employed and has health insurance through the business, then RwCOVR is set to "yes." RwCOVS is set to "yes" if the source is the spouse's current or previous employer, or union.

In Waves 3H and from Wave 4 forward, if the only source of coverage is the spouse's employer (current or previous) or union, then RwCOVR is set to "no." If the only source of coverage is the Respondent's employer (current or previous), union, or self-employment, then RwCOVS is set to "no." Otherwise if any source of coverage is "other," "don't know," or "refuse," then RwCOVR and RwCOVS are set to special missing .C, covered but don't know the source. This happens most often for self-employed Respondents in Waves 3H and 4 who did not have insurance through the business, but did through an employer. In Wave 3H and from Wave 4 on, if RwCOVS is .C and the spouse of the Respondent indicates whether or not the Respondent is covered by their (the spouse's) employer-provided insurance, then RwCOVS is set according to the spouse information.

Beginning in Wave 6, separate questions asked about particular sources of employer-provided health insurance for up to three plans. RwCOVR is set to "yes" if the source is the Respondent's current or previous employer, or union for any of the three plans. RwCOVS is set to "yes" if the source is the spouse's current or previous employer, or union for any of the three plans. The self-employed are no longer asked this question separately; it is combined with current employer. There is no single question about whether the Respondent has any employer-provided insurance as there is in other waves. If the number of insurance plans is more than zero, but no source is provided in any of the questions, then we know that the Respondent has some health insurance, but we don't know if it is provided by an employer. These cases are coded .E, for covered by health insurance but unknown whether it is employer-provided. Note that in Versions prior to G, these cases were coded .C, covered but unknown by whose employer.

Because questions are skipped based on the Respondent's marital status in Waves 6 and 7, spouse's current or previous employer is not directly asked as the source if the Respondent is not married/partnered. In prior waves, there is no such limitation, and some reported a spouse's employer as the source of insurance even when not married. In the early releases of 2002 and 2004 data, many specified the source of insurance as other. In the final releases, HRS has recoded based on interviewer notes to indicate a former or deceased spouse's employer as the source when appropriate. Thus R6COVS and R7COVS may be lower than in other waves simply due to the skip pattern, but is significantly improved over those based on the early release data. From Wave 8 forward, this was changed so that ever-married single Respondents are asked if the source of insurance is from a former spouse's current or previous employer.

S1COVR and S1COVS for Wave 1 are taken from the Financial Respondent's information appropriately. That is, if the Respondent is the Financial Respondent, then S1COVR and S1COVS are the Financial Respondent's spouse's information. But if the Respondent is the spouse of the Financial Respondent, then S1COVR and S1COVS are the Financial Respondent's information.

From Wave 2 on, SwCOVR is taken from the spouse's self-reported RwCOVS variable (Respondent covered by spouse's plan), if available. SwCOVS is taken from the spouse's self-reported RwCOVR variable. For Wave 3H and from Wave 4 on, if the spouse's self-report is not available or missing, the question about coverage of others besides the Respondent is used to determine if the Respondent's spouse is covered by the Respondent's plan; if so, then SwCOVR is set to yes.

Please see "Plan specific employer-provided health insurance: Source of insurance and who is covered" for information on individual plans reported.

### **Exit Interview Variables**

RECOVR indicates whether the Respondent was covered by an employer or previous employer's health insurance plan at the time of death. RECOVS indicates whether the Respondent was covered by a spouse or ex-spouse's employer's or previous employer's health insurance plan at time of death.

If the proxy indicates Respondent was covered by employer-provided health insurance, then the source of that insurance is checked.

If the source of any plan that covers the Respondent was the Respondent's current or previous employer, the Respondent's union, or through the Respondent's self-employment then RECOVER is set to "Yes." If the source of any plan that covers the Respondent was the spouse/ex-spouse's current or previous employer or the spouse/ex-spouse's union, then RECOVER is set to "Yes." If we know that the Respondent was covered by employer-sponsored insurance, but we don't know whether it was provided by the Respondent's or the spouse/ex-spouse's employer or former employer, we assign a value of .C indicating employer-provided insurance and it's not known whose employer it is. There are some cases where we know that the Respondent had a non-government health insurance plan but have no other source information, we assign a value of .E, indicating the Respondent had health insurance but it's unknown whether it was employer-provided.

In Wave 2H, we look at data from the Core Interview Wave 1 preload to determine if the Respondent had been covered by employer-provided health insurance. If the Respondent reported coverage by employer-provided health insurance in Wave 1, and if the proxy indicates that Respondent was still covered by that source in Wave 2H, the preload is used to determine whether the plan that covered the Respondent was the Respondent's own plan (RECOVER="yes") or from the spouse's plan (RECOVER="yes"). If the preload is not indicative of employer's health insurance coverage, then the proxy is asked more insurance questions in Wave 2H. If the source of any plan is from the Respondent's current or previous employer, union, or own business, then RECOVER is set to "yes." If the source of any plan is from the spouse's current or previous employer, or union, then RECOVER is set to "yes."

In Wave 3, RECOVER and RECOVER are constructed using the same method as used for Core Interview Measures for Wave 3. The proxy is asked if the Respondent had other non-government health insurance plans at death. If the source of the plan indicates the Respondent's former or previous employer or union then RECOVER="yes." If source indicates the spouse's plan or spouse's union, RECOVER="yes." If the source is unknown and no sources indicate the Respondent's employer, RECOVER is assigned .E, which means the Respondent was covered by health insurance but it's not known if the source is an employer. This is the same for the Respondent's spouse's employer. RECOVER is set to .E if the Respondent was covered by a health plan but it's not known if the source is a spouse's employer. If no health insurance is reported and none of the sources indicate the Respondent and Respondent's spouse's employer, then RECOVER and RECOVER are set to "no." As in the Core Interview Measures Wave 3, there are a large number of .E's, in Exit Wave 3, indicating the proxy responded to the question about the Respondent having health insurance at the time of death, but skipped the questions about the source of insurance.

In Wave 4, there are only two questions related to an employer insurance plan. First a question is asked of everyone, "At the time of death was the Respondent covered by any employer-provided health insurance?" The second question is "How many different employer-provided health insurance plans was the Respondent covered by when died?" Unlike all other waves there is no information about the source of employer provided plan or whose plan it was. If the first question is answered "yes" RECOVER and RECOVER are set to the special missing value .C, indicating the Respondent was covered by employer-provided insurance, but it's not known by whose employer.

In Wave 5, a lead-in question determines if the Respondent was covered by any employer-provided or self-employed health insurance at death. If no health insurance is reported in these questions, RECOVER and RECOVER are set to "no." If the Respondent reports having health insurance, insurance source questions are asked. If the source is the Respondent's current or previous employer or union, RECOVER is set to "yes." If the Respondent is self-employed and has health insurance through the business, then RECOVER is set to "yes." Likewise, RECOVER is set to "yes" if the insurance source is the spouse's current or previous employer, or union. However, if the only source of coverage is the spouse's employer (current or previous) or union, then RECOVER is set to "no." If the only source of coverage is the Respondent's employer (current or previous), union, or self-employment, then RECOVER is set to "no." Otherwise if any source of coverage is "other," "don't know," or "refuse," then RECOVER and RECOVER are set to special missing .C.

From Wave 6 forward, the proxy is asked how many non-government health insurance plans the Respondent had. There are separate questions asked about the specific sources of this employer-provided health insurance for up to three plans. If the Respondent's own business or current or former employer or union is the provider for the health insurance, then RECOVER is coded to "Yes." If the insurance is provided through the spouse's own business, current or previous employer or union, RECOVER is coded to "Yes." If the number of insurance plans is more than zero, but no source is provided in any of the questions, .E is assigned indicating the Respondent had insurance but it's not known if it was employer-provided insurance.

In Wave 13 forward we utilize preloads if the proxy indicates the Respondent was covered by the same insurance plan source as the previous wave. When these preloads are not available, then we use information reported during the most recently available last Core Interview.

## Core and Exit Differences

Exit Interview Waves 3A and 3H are similar to Core Interview Wave 3A.

In the Exit Interview Wave 4, the proxy is asked only two questions about employer insurance: 1) if the Respondent was covered by any employer-provided health insurance at death and, if so, 2) how many plans. There aren't questions that ask about specific sources of insurance; therefore, RECOVR and RECOVS from Exit Wave 4 are assigned a value of .C, indicating the Respondent was covered by an employer-provided insurance, but it's not known by whose employer.

Exit Interview Wave 6, a question about the Respondent obtaining insurance through a former employer is not included in the Exit Interview measures.

In Exit Interview Wave 13, the preload of the private insurance plan source for the three plans is not available. For this Wave we use information reported during the most recently available last Core Interview.

## Cross Wave Differences in Original HRS Data

### Core Interview Variables

In Wave 1, the health insurance questions are asked only of the Financial Respondent, about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only.

In Wave 1, the private health insurance questions begin with:

"Do you have any type of health insurance coverage obtained through your [or your spouse's] employer, former employer or union, such as Blue Cross-Blue Shield or a Health Maintenance Organization?"

If "yes," the Financial Respondent is asked how many plans and the source of up to 2 plans. The source of insurance can be the Respondent's current or former employer, the Respondent's union, the Respondent's spouse's current or former employer or union, and other. If the Financial Respondent is married and reported having employer-provided health insurance, the first question about the spouse's private health insurance coverage is:

"You told me earlier that you obtain health insurance through an employer or union. Is your spouse covered by the same insurance plan(s)?"

If so, the Financial Respondent is then asked by which (if more than one plan). The questions then ask if the Financial Respondent's spouse is covered by any other employer-provided health insurance, and if so, the source of up to 2 plans. This results in information on coverage of the Financial Respondent's spouse on up to 4 employer-provided health insurance plans. For the Financial Respondent in Wave 1, and for Waves 2H and 3, up to 2 insurance plans are asked about. From Wave 4 forward, only 1 employer-provided health insurance plan is asked about. The question wording asks for information about plans in order of importance.

In Wave 2H, if preloaded information indicates the Respondent was covered by any employer-provided health insurance in Wave 1, the following question is asked:

"According to our records, in [Wave 1 interview month] you were covered by health insurance from [source of plan preloaded from W1]. Are you still covered by the same employer health insurance policy as before?"

If "yes," no further questions on source of insurance are asked. If the Respondent is the Financial Respondent in Wave 2H and says the records show wrong coverage, a follow-up question asks for a corrected source of insurance at the last interview and whether the Respondent is still covered. If the Respondent was not the Financial Respondent in Wave 1 and says the records show wrong coverage, or if the Respondent (the Financial Respondent or not) responds with any other answer except "yes," questions almost identical to those asked in Wave 1 regarding coverage and its source are asked.

In Wave 2H, additional answers for the source of health insurance are possible. In particular, "Through own business" and "Purchased through own business/self-employment" are added to address the coverage of those self-employed.

In Wave 2A, questions about other health insurance are asked, but there are no questions to indicate whether the source of that insurance is a current or previous employer.

In Wave 3A, the question about other health insurance is followed up by asking the source of the insurance. Besides current or previous employers and unions of the Respondent and spouse, the source can be other organizations or self. There are two questions about source of coverage, one for the first, or most important plan, and the other about other plans, with the option to answer all that apply. If the number of plans was given as zero, both these questions were asked. In the derivation of this variable, a "don't know" or "refuse" response with regard to the other plans is ignored when the number of plans is zero. Since many valid responses are given about the source of the first plan when the number of plans is zero, we assume that there is at least one health plan. Due to an apparent skip problem in some versions of the HRS instrument, over 1,000 cases responded yes to the question about having other insurance, but then skipped all questions about its source.

In Waves 3H, 4 and 5, self-employed Respondents are asked: "Do you have health insurance through that business that pays hospital or doctor bills?" If self-employed and not covered through the business, or if not self-employed, the Respondent is asked if they are covered by any employer-provided health insurance.

If "yes," the source of the coverage is asked. Unfortunately, in Waves 3H and 4, the specific source of coverage was skipped if the Respondent was self-employed, not covered by the business, but was covered by an employer-provided insurance. This is corrected in Wave 5.

In Waves 6 and 7, the questions about sources of employer-provided health insurance are asked about up to three plans, and they are asked differently than in previous waves. The questions about source of insurance are asked separately, in the following order until the source is reported:

1. Only if the Respondent is working: "Do you obtain this health insurance through Current employer/Own Business of yours?"
2. "Do you obtain this health insurance through a former employer of yours?"
3. Only if the Respondent is married/partnered: "Do you obtain this health insurance through your spouse/partner's Current employer?"
4. Only if the Respondent is married/partnered: "Do you obtain this health insurance through your spouse/partner's former employer?"
5. "Did you purchase this plan directly from an insurance company, through your/your spouse's union, through a group such as AARP, a church, or other organization, or what?"

From Wave 8 forward, question 3 is also asked of those who are separated, divorced, or who have had their marriage annulled, with the following wording: "Do you obtain this health insurance through your former spouse/partner's Current employer?" Question 4 is asked of this expanded group and those who are widowed as: "Do you obtain this health insurance through your former spouse/partner's former employer?"

Note that in prior waves, the Respondent's current employer could be given as the source even if the Respondent is not working, and the spouse's employer could be given as the source even if the Respondent is not married or partnered. Former and deceased spouse's employers have been coded as the source if mentioned in response to the 5th question in the final release of 2002 (W6) and 2004 (W7) data.

For Wave 3H and from Wave 4 forward, if coverage is from the Respondent's employer or union, the Respondent is also asked who else is covered on this health insurance, and the response options include a code for spouse.

From Wave 13 forward, if the Respondent was covered by the same insurance plan as previous interview, we use data from a preload; however, in Wave 13 the preload fields were not all available so we use information from the last completed Core Interview.

### **Exit Interview Variables**

For Wave 2H we use Core Interview preloads if the proxy indicates the Respondent was covered by the same insurance as in Wave 1.

In Waves 2H, 4 and 5, there are special cases coded as .C, indicating the Respondent was covered by employer-provided insurance, but it's not known by whose employer.

In Wave 3, and from Wave 6 forward, the private health insurance questions start with the number of non-government health insurance plans. If the proxy does not provide a source of the insurance, .E is assigned, indicating coverage but it's not known whether the insurance was obtained through an employer.

From Wave 6 forward, questions about sources of employer-provided health insurance are asked for up to three plans, and they are asked differently than in previous waves. The questions are asked separately, in the following order until the source and number of plans are reported:

1. How many other such plans did the Respondent have at the time of death? (Other than Medicare/HMO, do not include long-term care insurance)
2. Only if the Respondent was working: "Did the Respondent obtain this health insurance through Current employer/Own Business?"
3. "Did the Respondent obtain this health insurance through a former employer?"
4. Only if the Respondent was married/partnered: "Did the Respondent obtain this health insurance through his/her spouse/partner's current employer?"
5. Only if the Respondent was married/partnered: "Did the Respondent obtain this health insurance through his/her spouse/partner's former employer?"
6. "Did the Respondent purchase this plan directly from an insurance company, through his/her spouse's union, through a group such as AARP, a church, or other organization, or what?"

Please note that responses to question three of the Exit interview measures for Wave 6 were not available.

Responses from Waves 6 through 8 include a code for former or deceased spouse's employer/union in question six.

From Wave 8 forward, question 4 is asked for those who are separated, divorced, or who have had their marriage annulled, with the following wording: "Did s/he obtain this health insurance through his/her former spouse/partner's current employer?" Question 5 and 6 are asked of this expanded group and those who are widowed as: "Did s/he obtain this health insurance through his/her former spouse/partner's former employer?"

From Wave 13 forward, if the proxy indicates the Respondent was covered by the same insurance plan as the Respondent's previous Core interview, we use data from a preload; however, in Wave 13 the preload fields were not available so we use information reported during the most recently available last Core interview.

## How Constructed

RwCOVRT indicates whether the Respondent's employer-provided health insurance covers retirees. In Waves 1 and 2H, this is taken from a direct question that asks whether a plan covers retirees. In Wave 3H and from Wave 4 forward, it is taken from a question that asks about coverage up to age 65.

SwCOVRT indicates whether health insurance from the employer of the Respondent's spouse or partner covers retirees.

The number of insurance plans about which information is gathered varies across waves. In Wave 1, a question asks if the plan covers retirees, for each plan. If any plan provided by the Respondent's current or previous employer, or union covers retirees, then RwCOVRT is set to "yes." If no plan is provided by the Respondent's employer or union, then RwCOVRT is set to .N, no plan.

In Wave 2H, if the Respondent indicates that they are still covered by their own employer-provided health plan reported in Wave 1, the Wave 1 information is assumed to be correct for Wave 2H as well, i.e., R2COVRT is set to R1COVRT. If Wave 2H employer-provided health insurance is not a continuation of the preloaded Wave 1 coverage, the Wave 2H question about whether the plan covers retirees is used to set RwCOVRT. If any plan from the Respondent's current or previous employer, or union covers retirees, then RwCOVRT is set to "yes." If no plan is provided by the Respondent's employer or union, then RwCOVRT is set to .N, no plan.

In Wave 3H and from Wave 4 forward, this question is no longer asked. Another question asks if the plan would cover the Respondent up to age 65. Since this seems to be asking about insurance coverage of early retirees, this question was used for the RwCOVRT variables in Wave 3H and from Wave 4 forward. If coverage can continue to age 65, then RwCOVRT is set to yes. If the Respondent is already 65 then RwCOVRT is set to .A - already 65, and if the plan(s) are not from the Respondent's current or previous employer, RwCOVRT is set to .S - question skipped. Note that if the source of insurance is the Respondent's union or through

self-employment, these questions are not asked, so RwCOVRT is set to .S. If the Respondent does not report being covered by the Respondent's employer, then RwCOVRT is set to .N - no plan.

In all waves, if missing whether the Respondent is covered, then RwCOVRT is set to .H, missing whether covered by employer-provided insurance. If the question was asked or should have been asked, and the answer is missing then RwCOVRT is set to .D for don't know, .R for refused, and .M for all other missing answers.

In Waves 2A and 3A, this question is not asked. In Wave 3A, special missing values are set for no insurance (.N), if the Respondent is older than 65 (.A), and if RwCOVR is missing (.H). For all other situations, and for everyone in Wave 2A, RwCOVRT is set to .Q to indicate that no information is available this wave.

SwCOVRT for Wave 1 is taken from the Financial Respondent's information appropriately. That is, if the Respondent is the Financial Respondent, then S1COVRT is the Financial Respondent's spouse's information. But if the Respondent is the spouse of the Financial Respondent, then S1COVRT is the Financial Respondent's information.

From Wave 2 on, this information is taken from the spouse's self-reported RwCOVRT variable, if available. If the Respondent is not married, SwCOVRT is set to .U=unmarried. If the Respondent's spouse did not respond then SwCOVRT is set to .V=Spouse is non-response.

Please see "Plan specific employer-provided health insurance: Coverage in retirement" for information on individual plans reported. These more detailed variables also provide information as to whether the coverage extends to those over 65 in the waves when this information is available.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, the health insurance questions are asked only of the Financial Respondent, about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only.

In Wave 1 a question asks if the plan covers retirees, for each plan (up to 4 between Respondent and spouse).

In Wave 2H, if preloaded information indicates the Respondent was covered by any employer-provided health insurance in Wave 1, the Respondent is asked if this coverage continues. If so then no question about whether the plan covers retirees is asked. If not, or if not covered in Wave 1, current employer provided health insurance plans are asked about (up to 2). A question asks if the plan covers retirees for each plan.

In Waves 3H, and 4 forward, the question about whether a plan covers retirees is no longer asked. Other questions ask if the plan would cover the Respondent up to age 65 if they left the job before age 65 (if from current employer), or if the plan could be continued to age 65 (if from previous employer). This question is skipped if the Respondent is already 65, or if the employer-provided health plan is not from either the Respondent's current or previous employer (e.g., it is NOT asked if the plan source is a union, spouse's employer, or through the Respondent's self-employment). From Wave 6 forward this question is asked for up to three plans.

In Waves 2A and 3A, no question about retiree coverage or coverage before age 65 is asked.

In some waves, if health insurance extends to age 65, a follow-up question asks if those over 65 may also be covered. The RwCOVRT variables do not provide any information from these follow-up questions. Please see "Plan specific employer-provided health insurance: Coverage in retirement" for information on individual plans reported. These more detailed variables also provide information as to whether the coverage extends to those over 65 in the waves when this information is available.

In Waves 13 forward, if the Respondent indicates that they are still covered by their own health plan reported in the preloaded health plan information and a plan source is indicated, then the coverage in retirement questions are not asked and the value for RwCOVRT is carried forward from the last completed Core Interview.

## General Comments

Private health insurance plans encompass all plans purchased on the private market, including coverage purchased through an employer, the individual insurance marketplaces, a union, or a trade association. Previous versions of the RAND HRS Longitudinal File have included variables that describe private plans solely provided by current or former employers, and these variables are still provided for continuity purposes. RwPRPCNT is similar, but not identical, to RWHENUM. For Waves 1-5, RWHENUM is a count of employer-provided health insurance plans only, whereas RwPRPCNT is a count of all private health insurance plans, except long-term care insurance. From Wave 6 forward, RwPRPCNT and RWHENUM are the same, and both are a count of all private health insurance plans, except long-term care insurance. Please see the Number of private health insurance plans section for a full description of RwPRPCNT.

## How Constructed

RWHENUM is a count of the number of employer-provided/private health insurance plans the Respondent reports. This is taken from a direct question that asks, "How many plans do you have?"

For Waves 1-5, RWHENUM includes employer-provided health insurance plans only.

From Wave 6 forward, the RWHENUM includes all private health insurance plans.

In Wave 2H, if preloaded information indicates the Respondent was covered by any employer-provided health insurance in Wave 1 and the Respondent confirms this, the number of plans is not asked. In these cases the Respondent may confirm coverage from only one Wave 1 plan, so R2HENUM is set to .P = Covered in wave 1. It is unclear whether or not the Respondent has the same number of plans in Wave 2 as were reported in R1HENUM.

SwHENUM is a count of the number of health insurance plans the Respondent's spouse reports.

SwHENUM for Wave 1 is taken from the Financial Respondent's information appropriately. That is, if the Respondent is the Financial Respondent, then S1HENUM is the Financial Respondent's spouse's information. But if the Respondent is the spouse of the Financial Respondent, then S1HENUM is the Financial Respondent's information.

From Wave 2 on, this information is taken from the spouse's self-reported RWHENUM variable, if available. If the Respondent is not married, SwHENUM is set to .U=unmarried. If the Respondent's spouse did not respond, then SwHENUM is set to .V=Spouse is non-response.

## Cross Wave Differences in Original HRS Data

In Wave 1, the health insurance questions are asked only of the Financial Respondent about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only.

In Wave 1, a question asks how many plans does Respondent have.

In Wave 2H, if preloaded information indicates Respondent was covered by any employer-provided health insurance in Wave 1, the number of plans is not asked. If Respondent is not covered in Wave 1 but is in Wave 2H, then Respondent is asked how many plans they have.

This question is not asked in Wave 2A and R2HENUM is set to .Q for AHEAD Respondents.

From Wave 3 forward, Respondent is asked how many plans they have.

## How Constructed

### Core Interview Variables

These variables provide source and coverage information about individual employer-provided health insurance plans. RWHESRCx, the source, may be a current or previous employer or union of the Respondent or spouse, and Respondent and spouse can be covered. If the Respondent is self-employed, health insurance provided by his business is considered employer-provided. There are variables for each plan. The number of plans for which information was collected varies from wave to wave. RWHESRCx indicates the source of the health insurance plan, where "x" denotes the plan number. RWHECOVx indicates who is covered under the plan.

For each plan the Respondent is asked for the source. If the plan is provided by the Respondent's business, current or previous employer or union, then we set RWHESRCx to "Respondent." If the plan comes from the Respondent's spouse's current or former employer or union or from an ex-spouse, then we set RWHESRCx to "Spouse."

We also collect information on who is covered under each insurance plan. If the Respondent reports that they are covered but no-one else is covered, then RWHECOVx is set to "Respondent only covered." If the Respondent is not given an opportunity to report if anyone else is covered or answers "don't know" or "refused" to the anyone else covered question, then RWHECOVx is set to "Respondent, don't know about Spouse." If the Respondent reports that their spouse is also covered under the Respondent's plan, then RWHECOVx is set to "Both."

In Wave 1 only the Financial Respondent answered the questions. They are asked first about their primary plan and whether others are covered under this plan, and then they are asked if their spouse has any additional health insurance plans. So it is possible for the spouse to be covered under the Financial Respondent's plan and not have any additional plans. Then, R1HESRC1=6 is a special value indicating that the Respondent is a Non-Financial Respondent and is only covered under the Financial Respondent's primary plan. If the non-Financial Respondent also has an additional plan, the R1HESRC1 will contain information about the additional plan, and the spouse variables (S1HECOV) will hold the information regarding the Financial Respondent's plan. So it is important to look at the spouse variables as well as the Respondent variables to get a full picture of the non-Financial Respondent's coverage in Wave 1.

In Wave 2H, the source of the plan is not asked if a preloaded value indicates that the Respondent reported being covered by employer-provided health insurance at Wave 1 and if the Respondent indicates that they are still covered by that source. The HRS documentation indicates that the preloaded value is taken from specific Wave 1 variables. In these cases, the Wave 1 variable is used to determine whether the plan that continues to cover the Respondent in Wave 2 is the Respondent's or the spouse's plan. If it is the Respondent's plan then R2HESRCx is set to "Respondent." If it is the spouse's plan then R2HESRCx is set to "Spouse." If the preloaded value does not indicate Wave 1 coverage, or if the Respondent does not say they are still covered by that source, then questions similar to the Wave 1 questions are asked, and if the source of any plan that covers the Respondent is the Respondent's current or previous employer, union, or own business, then R2HESRCx is set to "Respondent." If the source of any plan that covers the Respondent is the spouse's current or previous employer, or union, then R2HESRCx is set to "Spouse."

In Wave 2A, questions about non-government health insurance do not include any information about the source of the coverage.

So for the AHEAD Respondents, R2HESRCx and R2HECOVx are set to .Q, to indicate that no information is available.

From Wave 3 forward, the questions do not depend on answers given in previous waves. In Wave 3A, a question asks if the Respondent is covered by any non-government health plan besides long-term care insurance.

In Waves 3H, 4 and 5, a question asks if the Respondent is covered by any employer provided health insurance, or if self-employed, through the business. If no health insurance is reported in these questions RwHESRCx is set to "0" and RwHECOVx is set to .N - no employer related insurance. If the Respondent reports having health insurance, then RwHECOVx is set to "Respondent only." RwHESRCx is set to "Respondent" if the source is the Respondent's current or previous employer or union, or if the Respondent is self-employed and has health insurance through the business. If the Respondent reports that their spouse is also covered under this insurance, then RwHECOVx is set to "Both." RwHESRCx is set to "Spouse" if the source is the spouse's current or previous employer or union. If the Respondent doesn't know if anyone else is covered or reports that someone else is covered but doesn't know who, then RwHECOVx is set to "Respondent, don't know about spouse."

In Wave 3A, if the source of insurance is unknown (DK/RF), then RwHESRCx and RwHECOVx are set to missing (.D/.R). If no source is unknown and none of the sources indicate the Respondent's and the Respondent's spouse's employer, then RwHESRCx is set to "0" and RwHECOVx is set to .N.

In Wave 3H and from Wave 4 forward, if the Respondent reports employer-provided insurance but the source of coverage is "other," "don't know," or "refused" then RwHESRCx is set to special missing .C, covered but don't know the source. RwHECOVx is still reported and so it is possible for RwHESRCx to be a special missing and RwHECOVx not missing. This happens most often for self-employed Respondents in Waves 3H and 4 who did not have insurance through the business but did through an employer. In Wave 3H and from Wave 4 on, if RwHESRCx is .C and the spouse of the Respondent indicates whether or not the Respondent is covered by their (the spouse's) employer-provided insurance, then RwHESRCx is set according to the spouse information.

Beginning in Wave 6, the self-employed are no longer asked the health insurance question separately; it is combined with current employer. Note that because questions are skipped based on the Respondent's marital status in Waves 6 and 7, spouse's current or previous employer is not directly asked as the source if the Respondent is not married/partnered. In prior waves, there is no such limitation, and some reported a spouse's employer as the source of insurance even when not married. From Wave 8 forward, ever-married Respondents are asked about former spouse's employers as the source of insurance.

S1HESRCx and S1HECOVx for Wave 1 are taken from the Financial Respondent's information appropriately. That is, if the Respondent is the Financial Respondent, then S1HESRCx and S1HECOVx are the Financial Respondent's spouse's information. But if the Respondent is the spouse of the Financial Respondent, then S1HESRCx and S1HECOVx are the Financial Respondent's information.

From Wave 2 on, SwHESRCx and SwHECOVx are derived from the spouse's self-reported RwHESRCx and RwHECOVx variables, if available.

## Exit Interview Variables

REHESRC1, REHESRC2 and REHESRC3 provide source and coverage information about individual employer-provided health insurance plans. The source may be a current or previous employer or union of the Respondent or spouse. If the Respondent is self-employed, health insurance provided by the business is considered employer-provided too. The number of plans about which data was collected varies across the waves. There are up to two plans for Waves 2H to 5, and up to three plans from Wave 6 on. REHESRCx indicates the source of the health insurance plan, where "x" denotes the plan number, 1, 2 or 3.

If the plan is provided by the Respondent's own business, last or former employer or union, then REHESRCx is coded to "Respondent." If the plan is from the Respondent's spouse's current or former employer or union or from an ex-spouse, then REHESRCx is set to one of the "Spouse" codes. In Waves 1 through 5 for both the Core Interview and the Exit Interview measures there is no distinction between current or former spouse, therefore the code for any spouse is "Current Spouse." In Wave 6 and on, more specific survey questions are asked of those with different marital situations, to add the code "Former Spouse."

If there are no plans reported, REHESRC1=0 and REHESRC2=0 for all waves and REHESRC3=0 for Waves 6 on. For Waves

2H to 5, when the number of plans is reported as 1, REHESRC2=.X and REHESRC3=.X, indicating no more plans. From Wave 6 on, when the number of plans is reported as 2, REHESRC3=.X, no more plans.

For Exit Interview Wave 2H, the proxy is not asked about the source of the plan if the proxy indicates that the Respondent had the same plan as captured in the preload, and the preload value indicates the Respondent reported being covered by employer-provided insurance at Wave 1. If the preloaded values do not indicate Wave 1 coverage or the proxy does not say it is the same coverage, then questions are asked about an insurance plan.

For Waves 3 and 6 forward if the proxy indicates a health insurance plan and the plan's source is unknown and no sources indicate either the Respondent's or spouse's employer, REHESRCx is assigned .T, meaning the Respondent is covered but we don't know whether by an employer. If no health insurance is reported, or no source is known or none of the sources indicate the Respondent's or the Respondent's spouse's employer, then REHESRCx is coded 0="No employer provided insurance."

Wave 4 has no questions that ask about specific sources for the employer-provided insurance. The proxy is asked if the Respondent had an employer-provided plan and, if so, how many plans. When the proxy indicates that the Respondent had employer-provided plan, REHESRCx are as assigned a value of .C, indicating the Respondent is covered by employer-provided insurance but it's not known by whose employer.

In Wave 5, a lead-in question determines if the Respondent was covered by any employer-provided or self-employed health insurance at death. If the proxy reports that that the Respondent had health insurance, source questions are asked about up to two plans.

In Waves 6 and 7, there are skip patterns based on the Respondent's marital status, so spouse's employer or previous employer are not a possible sources if the Respondent is not married/partnered. In prior waves, there is no such limitation, and some reported a spouse's employer as the source of insurance even when not married. From Wave 8 forward, any Respondent that ever reports are asked about former spouse's employers as the source of insurance.

In Wave 13, the proxy is asked if the health insurance plan that the Respondent had reported at the last Core Interview is the same plan that covered the Respondent at death. The preload variables for these health insurance plans are not included in the Wave 13 release of the Exit Interview measures. If the previous plan is indicated we pull forward information on REHESRCx for up to three plans from the last Core Interview before death.

### **Core and Exit Differences**

Exit Interview Waves 3A and 3H are similar to Core Interview Wave 3A.

In Exit Interview Wave 4 the proxy is not asked questions about the specific source of employer-provided insurance, so REHESRCx from this wave is assigned a value of .C, indicating the Respondent was covered by employer-provided insurance but it's not known by whose employer.

Exit Interview Wave 4 and Exit Interview Wave 5 utilize the number of plans in assigning a code to REHESRC2. If the number of plans is 1, REHESRC2=.X.

In Exit Interview Wave 6 the question about obtaining insurance through a Respondent's former employer is not included.

In Exit Interview Wave 13, the proxy is asked if the preload plans are still the same as the plan the Respondent had at death? If this is the case, the last Core Interview measures are utilized. This is done for up to 3 plans.

### **Cross Wave Differences in Original HRS Data**

#### **Core Interview Variables**

In Wave 1, the health insurance questions are asked only of the Financial Respondent, about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only.

In Wave 1, the private health insurance questions begin with: "Do you have any type of health insurance coverage obtained through your [or your spouse's] employer, former employer or union, such as Blue Cross-Blue Shield or a Health Maintenance Organization?" If yes, the Financial Respondent is asked how many plans and the source of up to two plans. The source of insurance can be the Respondent's current or former employer, the Respondent's union, Respondent's spouse's current or former employer or union, and other. If the Financial Respondent is married and reported having employer-provided health insurance, the first question about the spouse's private health insurance coverage is: "You told me earlier that you obtain health insurance through an employer or union. Is your spouse covered by the same insurance plan(s)?"

If so, the Financial Respondent is then asked by which (if more than one plan). The questions then ask if the Financial Respondent's spouse is covered by any additional employer-provided health insurance, and if so, the source of up to two plans. We also collect information for up to two plans for the spouse. If the spouse is covered by the Financial Respondent's plan and also has additional plans, then we use additional information first and the Financial Respondent's plan information can be found in the S1HESRCx and S1HECOVx variables. If they do not have additional plans and are only covered by the Financial Respondent's plan, then we use the special value '6' to indicate that the Respondent is a covered Non-Financial Respondent.

So R1HESRC1 is the first plan the Respondent reported to be covered under and R1HERTR1 is the first plan the Respondent reported to be covered in retirement. The analyst must look at the source variable to see whose employer is providing the coverage. This is only true in Wave 1 - in later waves if the source is not the Respondent's employer, the retirement coverage questions are not asked. So in later waves when SwHERTR1=1, then SwHESRC1=2 (Spouse's employer). In Wave 2 if the Respondent says they are still covered under their Wave 1 plan, then we carry their first Wave 1 plan information forward.

The definition of these new insurance variables is slightly different from the more general ones (RwCOVR/RwCOVS and RwCOVRT) and the two sets do not always match up. For example, there are 9 cases in Wave 1 where the Respondent says they have one plan but gives information about two. For these cases R1COVR=1, but in the detailed variable derivation the number of plans limits the plan information examined, so the second plan source is ignored. There are also 18 cases that have R2COVRT=1, but the detailed variables do not indicate coverage in retirement. For R2COVRT, the Wave 2 information is being carried forward from the second plan in Wave 1. The detailed variable derivation only carries information on one Wave 1 plan forward to Wave 2, so the detailed variable R2HERTR2 is set to .P instead of 1.

For the Financial Respondent in Wave 1, and for Waves 2H and 3, up to two insurance plans are asked about. In Waves 4 and 5, only one employer-provided health insurance plan is asked about. The question wording asks for information about plans in order of importance. From Wave 6 forward, data is collected about three plans.

In Wave 2H, if preloaded information indicates the Respondent was covered by any employer-provided health insurance in Wave 1, the following question is asked: "According to our records, in [Wave 1 interview month] you were covered by health insurance from [source of plan preloaded from W1]. Are you still covered by the same employer health insurance policy as before?" If yes, no further questions on source of insurance are asked. If the Respondent is the Financial Respondent in Wave 2H and says the records show wrong coverage, a follow-up question asks for a corrected source of insurance at the last interview and whether the Respondent is still covered. If the Respondent was not the Financial Respondent in Wave 1 and says the records show wrong coverage, or if the Respondent (Financial Respondent or not) responds with any other answer except "yes," questions almost identical to those asked in Wave 1 regarding coverage and its source are asked.

In Wave 2H, additional answers for the source of health insurance are possible. In particular, "Through own business" and "Purchased through own business/self-employment" are added to address the coverage of those self-employed.

In Wave 2A, questions about other health insurance are asked but there are no questions to indicate whether the source of that insurance is a current or previous employer.

In Wave 3A, the question about other health insurance is followed up by asking the source of the insurance. Besides current or previous employers and unions of the Respondent and spouse, the source can be other organizations or self. There are two questions about source of coverage, one for the first, or most important plan, and the other about other plans, with the option to answer all that apply.

In Waves 3H, 4 and 5, self-employed Respondents are asked: "Do you have health insurance through that business that pays

hospital or doctor bills?" If self-employed and not covered through the business, or if not self-employed, the Respondent is asked if they are covered by any employer-provided health insurance. If "yes," the source of the coverage is asked. Unfortunately, in Waves 3H and 4, the specific source of coverage was skipped if the Respondent was self-employed, not covered by the business, but was covered by an employer-provided insurance. This is corrected in Wave 5.

In Waves 6 forward, the questions about sources of employer-provided health insurance are asked about up to three plans, and they are asked differently than in previous waves. The questions about source of insurance are asked separately, in the following order until the source is reported:

1. Only if the Respondent is working: "Do you obtain this health insurance through Current employer/Own Business of yours?"
2. "Did you obtain this health insurance through a former employer of yours?"
3. Only if the Respondent is married/partnered: "Do you obtain this health insurance through your spouse/partner's Current employer?"
4. Only if the Respondent is married/partnered: "Do you obtain this health insurance through your spouse/partner's former employer?"
5. "Did you purchase this plan directly from an insurance company, through your/your spouse's union, through a group such as AARP, a church, or other organization, or what?"

From Wave 8 forward, question 3 is also asked of those who are separated, divorced, or who have had their marriage annulled, with the following wording "Do you obtain this health insurance through your former spouse/partner's Current employer?" Question 4 is asked of this expanded group and those who are widowed as: "Do you obtain this health insurance through your former spouse/partner's former employer?"

Note that in prior waves, the Respondent's current employer could be given as the source even if the Respondent is not working, and the spouse's employer could be given as the source even if the Respondent is not married or partnered. Former and deceased spouse's employers have been coded as the source if mentioned in response to the 5th question in the final release of 2002 (W6) and 2004 (W7) data.

For Wave 3H and from Wave 4 forward, if coverage is from the Respondent's employer or union, the Respondent is also asked who else is covered on this health insurance, and the response options include a code for spouse.

From Wave 13 forward, if the Respondent indicates plan source is same as last reported, we use data from a preload; however, in Wave 13 the preload fields were not all available so we use information from the last completed Core Interview.

## Exit Interview Variables

Wave 2H utilizes preloads if the proxy indicates the Respondent was covered by the same insurance as in Wave 1.

Note that in Waves 2H, 4 and 5, special cases are coded as .C, covered but it's not known by whose employer, Respondent's or spouse's. Interview Wave 4 proxy is only asked 2 questions about employer insurance. The first question is, "At time of death, was the Respondent covered by any employer-provided health insurance?" and "How many different employer-provided health insurance plans was the Respondent covered by when he died?" No questions about specific sources of insurance are asked, therefore Wave 4 is coded .C.

In Wave 3, and from Wave 6 forward, the first private insurance questions asked are the number of "other" (non-government) health insurance plans. If the proxy does not provide a source of the insurance, .E is assigned to indicate the presence of health insurance, and it's not known whether it was obtained through an employer.

From Wave 6 forward, questions about sources of employer-provided health insurance are asked about up to three plans, and they are asked differently than in previous waves. The questions about source of insurance are asked separately, in the following order

until the source and number of plans are reported,

1. How many other such plans did the Respondent have at the time of death? (Other than Medicare/HMO, do not include long-term care insurance).
2. Only if the Respondent was working "Do R obtain this health insurance through Current employer/Own Business?"
3. "Did the Respondent obtain this health insurance through a former employer?"
4. Only if the Respondent was married/partnered, "Did the Respondent obtain this health insurance through his/her spouse/partner's current employer?"
5. Only if the Respondent was married/partnered, "Did the Respondent obtain this health insurance through his/her spouse/partner's former employer?"
6. "Did the Respondent purchase this plan directly from an insurance company, through his/her spouse's union, through a group such as AARP, a church, or other organization, or what?"

Please note that responses to question three of the Exit interview measures for Wave 6 were not available thus REHESRCx is constructed without that response.

Responses from question 6 from Exit Interview Waves 6 through 8 include a code for former or deceased spouse's employer/union.

From Wave 8 forward, question four is also asked of those who are separated, divorced, or who have had their marriage annulled, with the following wording, "Did s/he obtain this health insurance through his/her former spouse/partner's current employer?" Questions five and six are asked of this expanded group and those who are widowed as, "Did s/he obtain this health insurance through his or her former spouse/partner's former employer?"

From Exit Wave 13 forward we utilize preloads if the proxy indicates the Respondent was covered by the same insurance plan source as the previous wave. Since the preload plan source was not included in our data for Exit Wave 13, we utilize the last Core Interview measures.

## How Constructed

RwHERTRx indicates whether the Respondent's employer-provided health insurance covers the Respondent in retirement. RwhERTSx indicates whether the Respondent's employer-provided health insurance covers the spouse in retirement. The questions about coverage in retirement are only asked if the Respondent is covered by the Respondent's current or previous employer.

In Waves 1 and 2H, this is taken from the question that asks whether the plan covers retirees. In Wave 3H and from Wave 4 forward, it is taken from a question that asks about coverage up to age 65. And from Wave 5 forward, an additional question asking about coverage after 65 is used.

SwHERTRx and SwHERTSx indicate whether health insurance from the employer of the Respondent's spouse or partner covers the Respondent or spouse in retirement, respectively.

RwHERET summarizes whether the Respondent is covered in retirement under any plan, either their own or the spouse's. SwHERET summarizes whether the spouse is covered in retirement under any plan.

The number of insurance plans about which information is gathered varies across waves. In Wave 1, a question asks if the plan

covers retirees, for each plan.

In Wave 2H, if the Respondent indicates that they are still covered by their own employer-provided health plan reported in Wave 1, the Wave 1 information is assumed to be correct for Wave 2H as well, i.e., R2HERTR1 is set to R1HERTRx, where 'x' is the first plan that agrees with the source of coverage presented in Wave 2H. If Wave 2H employer-provided health insurance is not a continuation of the preloaded Wave 1 coverage, the Wave 2H question about whether the plan covers retirees is used to set R2HERTRx. We cannot tell from these questions if the Respondent is covered up to 65 or after 65 so we created a separate category for Wave 1 and 2, "Covers Retirees."

In Wave 3H and from Wave 4 forward, this question is no longer asked. In Wave 3H and from Wave 4 forward, another question asks if the plan would cover the Respondent up to age 65. If coverage can continue to age 65 in Waves 3H or 4, then RwhERTRx is set to "Covered now and to age 65, DK over age 65."

From Wave 5 forward, an additional question asks if the plan would cover the Respondent after age 65, allowing for additional categories for RwhERTRx: "Only covered to age 65," "Covered up to and after age 65," or "Covered up to age 65, dk after 65." It is not possible for the Respondent to report being covered after 65 if they are not covered up to 65.

If the Respondent is already 65 then RwhERTRx is set to .A - already 65, and if the plan(s) are not from the Respondent's current or previous employer, RwhERTRx is set to .N - No employer-provided insurance. In Wave 5, if the Respondent is self-employed they are not asked any retirement questions and so they are set to .S - question not asked.

Similar questions ask if the spouse is covered in retirement by the Respondent's plan and RwhERTSx is assigned from these questions the same way as described above. The spouse question is in the Waves 3H and 4 questionnaire but no data are collected. In Waves 2A and 3A, retirement questions are not asked. Since no information is available in Waves 3 and 4, we do not include RwhERTSx variables in these waves. In Wave 2A, R2HERTSx is set to special missing values .Q - no information is available this wave.

SwHERTRx for Wave 1 is taken from the Financial Respondent's information appropriately. That is, if the Respondent is the Financial Respondent, then S1HERTRx is the Financial Respondent's spouse's information. But if the Respondent is the spouse of the Financial Respondent, then S1HERTRx is the Financial Respondent's information.

From Wave 2 on, this information is taken from the spouse's self-reported RwhERTRx and RwhERTSx variable, if available, and assigned to SwHERTSx and SwHERTRx, respectively. If the Respondent is not married, SwHERTRx and SwHERTSx are set to .U=unmarried. If the Respondent's spouse did not respond then SwHERTRx and SwHERTSx are set to .V=Spouse is non-response.

RwHERET is the maximum retirement coverage reported for the Respondent, derived by examining all RwhERTRx and SwHERTRx variables. If any of these variables are missing values besides .N for no coverage, .X for no more plans, or .U for unmarried, then RwHERET is set to missing. If only one type of missing value is observed then that is the missing value assigned to RwHERET. If more than one type of missing value is observed, then RwHERET is set to .M.

SwHERET is the maximum retirement coverage reported for the spouse, derived by examining all RwhERTSx and SwHERTSx variables. SwHERET is set to missing values in the same way as RwHERET is. Note that in Waves 3 and 4, SwHERET is based only on the spouse's responses with regard to the insurance coverage they provide, because there are not RwhERTSx variables.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, the health insurance questions are asked only of the Financial Respondent, about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only. Please see the description of cross-wave differences for "Source of insurance and who is covered" for details on how those questions varied over time.

In Wave 1, for each plan, a question asks: "Is this health plan available to people who retire?" and "Can the spouses of retired employees be covered under this plan?"

In Wave 2H, if preloaded information indicates the Respondent was covered by any employer-provided health insurance in Wave 1, the

Respondent is asked if this coverage continues. If so, then no question about whether the plan covers retirees is asked. If not, or if not covered in Wave 1, current employer-provided health insurance plans are asked about (up to two). For each plan, the questions about retiree coverage are asked with the same wording as in Wave 1.

In Wave 3H, and Wave 4 forward, the question about whether a plan covers retirees is no longer asked. Other questions ask if the plan would cover the Respondent up to age 65 if they left the job before age 65 (if from current employer), or if the plan could be continued to age 65 (if from previous employer). The question wording is: "[If you left your current employer now could you]/[Can you] continue this [health] insurance coverage for yourself up to the age of 65?"

This question is skipped if the Respondent is already 65, or if the employer-provided health plan is not from either the Respondent's current or previous employer (e.g., it is NOT asked if the plan source is a union, spouse's employer, or through the Respondent's self-employment). From Wave 6 forward this question is asked for up to three plans.

From Wave 5 forward, an additional question asks if the plan would cover the Respondent after age 65. It is only asked if the Respondent reported being covered up to age 65. The question wording is: "[If you left your current employer now,] Does your employer offer some type of health insurance coverage for you after the age of 65?"

Similar questions ask if the spouse is covered in retirement by the Respondent's plan: "[If you left your current employer now could you]/[Can you] continue your current health insurance coverage for your spouse until he/she is age 65?" The question is in the Waves 3H and 4 questionnaire, but no data was collected.

From Wave 5 forward, if the spouse can be covered up to age 65, another question asks: "[If you left your current employer now,] Does your employer offer some type of health insurance coverage for your spouse after the age of 65?"

In Waves 2A and 3A, no question about retiree coverage or coverage before age 65 is asked.

In Waves 13 forward, if the Respondent indicates that they are still covered by their own health plan reported in the preloaded health plan information and a plan source is indicated, then the coverages in retirement questions are not asked and the values for R<sub>w</sub>HERTR<sub>x</sub> and R<sub>w</sub>HERTS<sub>x</sub> are carried forward from the last completed Core Interview. In Wave 13, there were some cases where the preloaded plan source was not available. In these cases the values for R<sub>w</sub>HERTR<sub>x</sub> and R<sub>w</sub>HERTS<sub>x</sub> are also carried forward from the last completed Core Interview.

## How Constructed

RwHIOTHP indicates whether the Respondent is covered by any health insurance other than government, employer-provided, or long-term care insurance. SwHIOTHP provides the information for the Respondent's spouse or partner.

The question wording and the sample that is asked these questions vary across waves. The relevant questions follow those that inquire about government and employer-provided insurance, and in some waves, are not asked if these types of insurance apply. Because of these differences, the analyst may want to consider this measure in conjunction with other types of insurance coverage.

Generally, if the Respondent indicates that they are currently covered by Basic health, Medigap or any other health insurance programs besides long-term care insurance, and the coverage is not clearly provided by the government or an employer or union, then we set RwHIOTHP to yes =(1). If the Respondent responds no to questions about these types of insurance coverage then RwHIOTHP is set to no (=0). Otherwise, RwHIOTHP is set to a missing value based on missing values in the HRS variables. Specific codes used to set RwHIOTHP in each wave are listed under "Cross-Wave Differences."

In Wave 3H, and Wave 4, there are two, and in Wave 5 there are three relevant questions. One of them is skipped if the Respondent has Medicare and employer provided Medigap. The second is skipped if the Respondent is covered by any government or employer-provided insurance. In Wave 5 the third question is skipped if the Respondent is covered by Medicare, through self-employment, or if the Respondent answered the second question. If all these questions are skipped, we set RwHIOTHP to "0." In other waves, the questions are asked of everyone.

In Wave 2A, 3A and from Wave 6 forward, the other health insurance questions are asked in combination with, or as part of a series of questions including employer-provided insurance questions.

Note that coverage by RwHIOTHP decreases somewhat from Wave 6 forward. This may be because the question structure is considerably different from that in previous waves.

SwHIOTHP for Wave 1 is taken from the Financial Respondent's information appropriately. That is, if the Respondent is the Financial Respondent, then S1HIOTHP is the Financial Respondent's spouse's information. But if the Respondent is the spouse of the Financial Respondent, then S1HIOTHP is the Financial Respondent's information.

From Wave 2 on, this information is taken from the spouse's self-reported RwHIOTHP variable, if available. In Waves 3H, 4, and 5, if the Respondent reports that the spouse is covered by their other insurance, this information is applied if the Respondent is married or partnered and the spouse's self-report is missing. If the Respondent is not married, SwHIOTHP is set to .U=unmarried. If the Respondent's spouse did not respond then SwHIOTHP is set to .V=Spouse is non-response.

## Cross Wave Differences in Original HRS Data

In Wave 1, the health insurance questions are asked only of the Financial Respondent, about the Financial Respondent's insurance coverage and, if married, the Financial Respondent's spouse's insurance coverage. From Wave 2 on, health insurance questions are asked of individual Respondents about their own coverage only.

In Wave 1 an initial question asks "Do you have any type of health insurance coverage, Medigap or other supplemental coverage, or long-term care insurance that is purchased directly from an insurance company or through a membership organization such as AARP (the American Association of Retired Persons)?" If the answer is "yes," then a second question, to which multiple answers may be given asks: "What kind of coverage do you have?" There are five categories of insurance coded: 1) BASIC HEALTH ("Hospitalization"), 2) MEDIGAP, 3) OTHER SUPPLEMENTAL HEALTH (AARP-NFS), 4) LONG-TERM CARE (incl. nursing home care) and 5) OTHER (SPECIFY). Each category is coded as a separate yes/no variable. If the Respondent reports any kind of coverage besides long-term care, then RwHIOTHP is set to "yes."

In Wave 2A, the questions are similar to those in Wave 1. A first question asks: "Do you have any (other) type of health insurance coverage?" If the answer is "yes," then a second question asks: "What kind of coverage do you have?" There are 5 different answers: 1) BASIC HEALTH ("Hospitalization"), 2) MEDIGAP, 3) OTHER SUPPLEMENTAL HEALTH, 4) LONG-TERM CARE and 5) OTHER (SPECIFY). Up to four responses are reported. If the Respondent reports any kind of coverage except long-term care, then RwhIOTHP is set to "yes."

In Wave 2H, separate questions ask about basic health and supplementary health insurance that are privately purchased:

a) "Do you have any basic health insurance coverage, purchased directly from an insurance company or through a membership organization such as AARP (American Association of Retired Persons)?"

b) "Do you have any type of supplementary health insurance coverage, such as Medigap or long-term care insurance that is purchased directly from an insurance company or through a membership organization such as AARP (American Association of Retired Persons)?"

If the answer to the second question is "yes," then the Respondent is asked: "What kind of coverage do you have?" There are many categories coded, including Medigap, other supplemental health, long-term care, heart/cardiac policy, cancer (including a combination of cancer and intensive care), dental insurance, Major Medical, "intensive care" or "catastrophic illness," "accident," hospitalization, disability, a policy that pays so much per day/per length of time, and other. Up to four responses are reported. If the Respondent reports any kind of coverage except long-term care, then RwhIOTHP is set to "yes."

In Wave 3A, questions ask if the Respondent has any health insurance other than government or long-term care and then ask for the source of the other insurance. The first question asks: "Not counting long-term care insurance or Medicare, (or Medicaid/or any other insurance we've discussed), do you have any other insurance that pays any part of hospital or doctor bills? Sometimes this is called a Medigap or Medicare Supplement policy.)" If the answer is "yes," then the number of plans is asked.

The source of the first or only plan is then collected: "[Thinking about the first of these plans] How did you obtain this type of health insurance coverage? Was it through your (or your husband's/or your wife's/or your partner's) employer or union, or through an organization or what?" Multiple answers are allowed and up to three responses are reported.

If there is more than one plan, a second follow-up question asks: "Thinking about your other health insurance plans, how did you obtain this type of health insurance coverage? Was it through your (or your husband's/or your wife's/or your partner's) employer or union, or through an organization or what?" Up to three responses are reported. If the Respondent reports the coverage is from "OTHER ORGANIZATION," "Self; not through any organization," or "OTHER," then RwhIOTHP is set to "yes."

In Waves 3H, 4 and 5, the questions are worded consistently. If the Respondent is covered by Medicare and does not report having an employer-provided Medigap plan, a first question asks: "Not counting long-term care insurance or Medicare, (or Medicaid/or any other insurance we've discussed), do you have any other insurance that pays any part of hospital or doctor bills? Sometimes this is called a Medigap or Medicare Supplement policy."

If the Respondent is not covered by any government or employer-provided insurance, a second question asks: "Do you have any basic health insurance coverage purchased directly from an insurance company or through a membership organization?" A subsequent question asked who else is covered. If the Respondent indicates that the spouse is covered, we apply the information on SwHIOHP if married.

In Wave 5, there is an additional question if the prior question was not answered and the Respondent is not covered by Medicare or through self-employment: "Not counting long-term care policies or the health insurance you already told me about, do you have any other health insurance coverage that you purchased directly from an insurance company or through a membership organization?"

Beginning in Wave 6, after asking about government insurance, a question first asks if the Respondent has any other health coverage besides long-term care insurance. This is followed by a series of questions of about the source of the private health insurance. The initial question is:

"Now, we'd like to ask about all the other types of health insurance plans you might have, such as insurance through an employer or a business, coverage for retirees, or health insurance you buy for yourself, including any (Medigap or) other supplemental coverage. Do not include long-term care insurance. Other than your Medicare HMO you've just told me about, or anything that you have just told me about, how many other such plans do you have?"

A series of follow-up questions ask separately about the source of the insurance until the source is identified. If the Respondent is currently working, the first question asks: "Do you obtain this health insurance through your (own business or professional organization/current employer)?" If the Respondent is not working, they are asked: "Do you obtain this health insurance through a former employer of yours?" If the Respondent is married or partnered, the next questions ask if insurance is obtained "through your (husband/wife/partner)'s current employer?" or "through your (husband/wife/partner)'s former employer?" If the source still has not been identified, a final question asks: "Did you purchase this plan directly from an insurance company, through your (or your [husband/wife/partner]'s/or your) union, through a group such as AARP, a church, or other organization, or what?" If the Respondent indicates that his coverage is from an insurance company, group or other, we set RWHIOTHP to "yes."

In Wave 1, Wave 2H and Wave 3H forward, the other health insurance questions asks if the Respondent purchased it by themselves. In Waves 2A and 3A, and from Wave 6 forward, the other health insurance questions are combined with employer provided insurance questions.

In Waves 3H, 4 and 5, if the Respondent has Medicare and employer provided Medigap, or no Medicare and has any government insurance, then the questions are skipped. For all other waves, the questions are asked of everyone.

## How Constructed

### Core Interview Variables

RwHILTC indicates whether the Respondent is covered by long-term care insurance. RwTYLTC indicates whether the long-term care insurance covers nursing home care only, in-home care only, or both. RwlTCPRM indicates the amount in nominal dollars that the Respondent pays monthly for long-term care coverage. SwHILTC, SwTYLTC, and SwLTCPRM provide the information for the Respondent's spouse or partner.

Though the question structure varies across waves, long-term care insurance coverage can be identified in all of them. If the Respondent indicates that they are currently covered by long-term care insurance, then RwHILTC is set to yes (=1). If the Respondent indicates not having coverage, then RwHILTC is set to no (=0). Otherwise, RwHILTC is set to a missing value based on missing values in the HRS variables.

In Wave 2A and from Wave 3 forward, there is a follow-up question(s) about the type of long-term care when the Respondent indicates having long-term care coverage. This question asks whether long-term care covers nursing home care only, long-term care at home, or both. RwTYLTC indicates the type of long-term care coverage based on this question. If the Respondent does not have long-term coverage, then RwTYLTC is set to skip (.S). In Wave 1, R1TYLTC and S1TYLTC are not available because the question is not asked.

If a Respondent indicates having long-term care coverage, there is a series of follow-up questions asking the amount the Respondent pays monthly for long-term care insurance premiums. In all Waves, the Respondent reports the amount paid as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts. If the Respondent does not report a clear time period for amount paid (e.g., lump sum, "other"), then the monthly amount cannot be calculated and RwlTCPRM is set to .K.

In Waves 1 and 2, the long-term care premium amount is included with the premium amounts for "other" types of insurance. If a Respondent indicates having long-term care and another type of "other" insurance, then RwlTCPRM is set to .C=Covered elsewhere.

The total amount for all "other" insurance listed can be seen in RWP<sub>PRM</sub><sub>x</sub>, where "x" indicates the plan number, 1 to 3. If the Respondent does not have long-term care coverage, then R<sub>W</sub>L<sub>T</sub>C<sub>PRM</sub> is set to skip (.S).

From Wave 6 forward, if the Respondent indicates that the long-term care coverage is included a previously described plan, then the premium questions are not asked and R<sub>W</sub>L<sub>T</sub>C<sub>PRM</sub> is set to .C to indicate that the long-term care premium is covered elsewhere.

In Wave 1, S1HILTC and S1LTCPRM are taken from the Financial Respondent's information as appropriate. That is, if the Respondent is the Financial Respondent, then S1HILTC and S1LTCPRM contain the Financial Respondent's spouse's information. If the Respondent is the spouse of the Financial Respondent, then S1HILTC and S1LTCPRM contain the Financial Respondent's information.

From Wave 2 on, SwHILTC, SwTYLTC, and SwLTCPRM are taken from the spouse's self-reported R<sub>W</sub>HILTC, R<sub>W</sub>TYLTC, and R<sub>W</sub>L<sub>T</sub>C<sub>PRM</sub> variables, if available. If the Respondent is not married, SwHILTC, SwTYLTC, and SwLTCPRM are set to .U=unmarried. If the Respondent's spouse did not respond then SwHILTC, SwTYLTC, and SwLTCPRM are set to .V=Spouse is non-response.

### **Exit Interview Variables**

REHILTC indicates whether the Respondent was covered by long-term care insurance at time of death. RETYLTC indicates whether the long-term care insurance covered nursing home care only, in-home care only, or both. RELTCPRM indicates the amount in nominal dollars that the Respondent paid monthly for long-term care coverage.

If the proxy indicates that the Respondent was covered by long-term care insurance, then REHILTC is set to yes (=1). If the Respondent did not have coverage, then REHILTC is set to no (=0). Otherwise, REHILTC is set to a missing value based on missing values in the HRS variables.

From Wave 3 forward, there is a follow-up question(s) about the type of long-term care when the proxy indicates the Respondent had long-term care coverage. This question asks whether long-term care covered nursing home care only, long-term care at home, or both. RETYLTC indicates the type of long-term care coverage based on this question. If the Respondent did not have long-term coverage, then RETYLTC is set to skip (.S). RETYLTC is not asked about in Wave 2H, and is set to .Q for Exit Interviews that occur in this wave.

If a proxy indicates the Respondent had long-term care coverage at time of death, there are a series of follow-up questions asking the amount the Respondent paid monthly for long-term care insurance premiums. In all Waves, the proxy reports the amount paid as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts. If the proxy does not report a clear time period for the amount paid (e.g., lump sum, "other"), then the monthly amount cannot be calculated and RELTCPRM is set to .K.

In Wave 2H, the long-term care premium amount is included with the premium amounts for "other" types of insurance. If a proxy indicates the Respondent had long-term care and another type of "other" insurance, then RELTCPRM is set to .C=Covered elsewhere. The total amount for all "other" insurance listed can be seen in REPR<sub>PRM</sub><sub>x</sub>, where "x" indicates the plan number, 1 to 3. If the Respondent did not have long-term care coverage, then RELTCPRM is set to skip (.S).

The premium questions are asked in the Exit Interviews beginning in Wave 4. RELTCPRM is set to .Q for Exit Interviews that take place before Wave 4.

From Wave 6 forward, if the proxy indicates that the long-term care coverage was included in a previously described plan, then the premium questions are not asked and RELTCPRM is set to .C to indicate that the long-term care premium is covered elsewhere.

## **Cross Wave Differences in Original HRS Data**

### **Core Interview Variables**

In Wave 1, the health insurance questions are asked only of the Financial Respondent, about the Financial Respondent's insurance coverage and, if married, their spouse's insurance coverage. From Wave 2 forward, health insurance questions are asked of individual Respondents about their own coverage only.

In Waves 1, 2H and 2A, there is a lead-in question asking whether the Respondent has any other health insurance. In Waves 1 and 2H, the question is: "Do you have any type of health insurance coverage, Medigap or other supplemental coverage, or long-term care insurance that is purchased directly from an insurance company or through a membership organization such as AARP (the American Association of Retired Persons)?" In Wave 2A, the question is: "Do you have any (other) type of health insurance coverage?"

A follow-up question asks the type of insurance. In Wave 1, any of five possible answers may be given: 1) basic health ("Hospitalization"), 2) Medigap, 3) other supplemental health (AARP-NFS), 4) long-term care (incl. nursing home care) or 5) other(specify).

In Wave 2A, the question asks: "What kind of coverage do you have? Is it basic health insurance, a supplement to Medicare (MEDIGAP) or other health insurance, long-term care insurance, or what?" There are 5 different answers: 1) Basic Health, 2) Medigap, 3) Other Supplemental plan, 4) Long-term Care and 5) Other Specify. Up to four responses are reported.

In Wave 2H, the question asks: "What kind of coverage do you have? Medigap or other supplemental health insurance, long-term care insurance, or what?" The possible responses are: 1) Medigap, 2) Other Supplemental health, 3) Long-term Care (incl. Nursing home care), 4) Heart /cardiac policy, 5) Cancer, 6) dental insurance, 7) Major medical, 8) Hospitalization, 9) Disability, 10) Policy that pays so much per day and 11) Other specific type of insurance.

In Waves 1 and 2H, there is no question about the type of long-term care coverage. In Wave 2A, the type of long-term care coverage is asked in two questions. The first question asks: "Do any of your policies include long-term or nursing home care?" The second question asks: "Does this plan cover home care?"

In Waves 1, 2H and 2A, the question about premiums asks about the amount paid for all listed types of insurance the Respondent indicated in the follow-up question about the type of insurance. These options are listed above. In Wave 1 and 2H, the question asks: "How much do you pay for this insurance?" In Wave 2A, the question asks: "(Again, not counting Medicare,) (How much do you pay for this policy/Taken together, how much do you pay for these policies?)" If a Respondent indicates having long-term care and another type of "other" insurance, then RwlTCPRM is set to .C=Covered elsewhere.

In Wave 3 and forward, the long-term care question is asked separately: "Not including government programs, do you now have any insurance which specifically pays any part of long-term care, such as, personal or medical care in the home or in a nursing home?" The type of long-term care question is: "Does this plan cover care in a nursing home facility only, personal or long-term care at home, or both in-home and nursing home care?"

In Waves 3 to 5, the long-term care premium question is: "About how much do you pay for this plan?"

From Wave 6 forward, the long-term care premium question is: "How much do you (or your [husband/wife/partner]) pay for this plan?/How much do you (or your [husband/wife/partner]) pay for this long-term care coverage?" If the Respondent indicates that the long-term care coverage is from a previously described plan, then the premium questions are not asked and RwlTCPRM is set to .C to indicate that the long-term care premium is covered elsewhere.

### **Exit Interview Variables**

In Wave 2H there is a lead-in question asking whether the Respondent has any other health insurance.

In Wave 2H, the question is: "Do you have any type of health insurance coverage, Medigap or other supplemental coverage, or long-term care insurance that is purchased directly from an insurance company or through a membership organization such as AARP (the American Association of Retired Persons)?" Note that in Wave 2H, there is no separately worded survey for the proxy.

A follow-up question asks the type of insurance. In Wave 2H, the question asks: "What kind of coverage do you have? Medigap or other supplemental health insurance, long-term care insurance, or what?" The possible responses are: 1) Medigap, 2) Other Supplemental health, 3) Long-term Care (incl. Nursing home care), 4) Heart /cardiac policy, 5) Cancer, 6) dental insurance, 7) Major medical, 8) Hospitalization, 9) Disability, 10) Policy that pays so much per day and 11) Other specific type of insurance.

In Wave 2H, there is no question about the type of long-term care coverage.

From Wave 3 forward, the long-term care question is asked separately: "Aside from the government programs, did [Respondent] have any insurance which specifically paid any part of long-term care, such as, personal or medical care in the home or in a nursing home?" The type of long-term care question is: "Did this plan cover care in a nursing home facility only, personal or long-term care at home, or both in-home and nursing home care?"

In Waves 4 and 5, the long-term care premium question is: "About how much was (he/she) paying for this plan before (his/her) death?"

From Wave 6 forward, the long-term care premium question is: "How much did (she/he) (or [you/ [his/her] [husband/wife/partner]]) pay per month for this (plan/long term coverage)?" If the Proxy indicates that the long-term care coverage is from a previously described plan, then the premium questions are not asked and RELTCPRM is set to .C to indicate that the long-term care premium is covered elsewhere.

## How Constructed

RwLIFEIN indicates whether the Respondent has any life insurance. This encompasses both whole life insurance policies, which are valid for an individual's entire life and include an investment component, as well as term life insurance policies, which are only valid for a predetermined period of time. RwWLIPRM indicates the amount in nominal dollars that the Respondent pays monthly for whole life insurance. RwTLIPRM indicates the amount in nominal dollars that the Respondent pays monthly for term life insurance. SwLIFEIN, SwWLIPRM, and SwTLIPRM provide this information for the Respondent's spouse or partner.

Life insurance coverage can be identified in all waves. The question asks if the Respondent (and in Waves 1 and 2A, the Financial Respondent's spouse) has any life insurance. The wording varies slightly across waves. It is asked at the household level of the Financial Respondent in Waves 1 and 2A, and at the Respondent level in Wave 2H and from Wave 3 forward. The variable for this question (RwLIFEIN) is simply recoded to 0/1 (No/Yes) and for missing values.

In Waves 1 through 3A, a series of follow up questions asks Respondents if any of these policies are for term life insurance, and if so, how much the premium is for their term life insurance [policy/policies]. The Respondent reports the amount paid as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts and reported in RwTLIPRM. If the Respondent does not report a clear time period for amount paid (e.g., missing, lump sum, "other"), then the monthly amount cannot be calculated and RwTLIPRM is set to .K. From Wave 3H forward, the question is not asked; in Wave 3H, RwTLIPRM is set to .Q and from Wave 4 forward, RwTLIPRM and SwTLIPRM are not available.

In Waves 1, 2A, 3A, and from Wave 5 forward, a series of follow up questions asks Respondents if any of these policies are for whole life insurance, and if so, how much the premium is for their whole life insurance [policy/policies]. The Respondent reports the amount paid as a fixed dollar amount per time period (e.g., bi-weekly, monthly). All dollar amounts are converted to monthly amounts and reported in RwWLIPRM. If the Respondent does not report a clear time period for amount paid (e.g., missing, lump sum, "other"), then the monthly amount cannot be calculated and RwWLIPRM is set to .K. In Waves 2H, 3H, and 4, the question is not asked; in Waves 2H and 3H RwWLIPRM is set to .Q and in Wave 4, RwWLIPRM and SwWLIPRM are not available.

For Waves 1 and 2A, SwLIFEIN, SwWLIPRM, and SwTLIPRM are taken from the Financial Respondent's information as appropriate. That is, if the Respondent is the Financial Respondent, then SwLIFEIN, SwWLIPRM, and SwTLIPRM contain the Financial Respondent's spouse's information. If the Respondent is the spouse of the Financial Respondent, then SwLIFEIN, SwWLIPRM, and SwTLIPRM contain the Financial Respondent's information.

In Wave 2H and from Wave 3 forward, the spouse information is taken from the spouse's self-reported RwLIFEIN, RwWLIPRM, and RwTLIPRM variables, if available.

If the Respondent is not married, SwLIFEIN, SwWLIPRM, and SwTLIPRM are set to .U=unmarried. If the Respondent's spouse did not respond then SwLIFEIN, SwWLIPRM, and SwTLIPRM are set to .V=Spouse is non-response.

### **Cross Wave Differences in Original HRS Data**

In Waves 1 and 2A, the life insurance questions are asked only of the Financial Respondent. Questions inquire about the Financial Respondent's insurance coverage and, if married, their spouse's insurance coverage. In Wave 2H and from Wave 3 forward, life insurance questions are asked of individual Respondents about their own coverage only.

For life insurance coverage, the question wording has varied slightly over time. In Waves 1, 2H, 5, and 6 forward, the question asks: "Do you have any life insurance, including individual or group policies?"

In Wave 2A, the question is preceded by: "My next questions are about life insurance. (First I will ask about insurance on own life then about insurance on your [spouse]'s life." The question then asks, "Do you yourself have any life insurance, including individual or group policies from a former employer or union or some other source?"

In Wave 1 and Wave 2A, a second question asks the Financial Respondent: "Does your [spouse] have any life insurance, including individual or group policies?"

In Wave 3A the question asks: "My next questions are about life insurance. Do you yourself have any life insurance, including individual or group policies from a former employer or union or some other source?"

In Waves 3H and 4 the question asks: "Do you currently have any life insurance?"

For term life insurance premiums, the question wording varies. In Waves 1 and 2H, the initial question asks, "Are any of these group or individual term insurance policies?" and the follow up questions asks, "About how much do you pay for (this/these) term insurance (policy/policies) each month or year?"

In Waves 2A and 3A, the initial question asks "Are any of these term insurance policies?" If the Respondent indicates they have only one term life insurance policy, the follow up question asks, "About how much do you pay for that insurance?" If the Respondent indicates they have more than one term life insurance policy, in Wave 2A, the follow up question asks, "About how much do you pay for the largest term insurance policy you have?" and in Wave 3A asks, "How much (in total) do you pay in premiums for term insurance?"

In Wave 2A, note that for term life insurance premiums, only the premium for the largest term policy is recorded. Also note that from Wave 4 forward, there are no questions about term life insurance premiums.

For whole life insurance premiums, the question wording varies across Waves. In Waves 1, 2A, and 3A, the initial question asks, "Do you have any life insurance policies that build up a cash value or that you can borrow on?" and includes the clarification, "Def: (These are sometimes called 'Whole Life' or 'Straight Life Policies.')

In Wave 1, the follow up question asks, "How much in total are the monthly or annual premiums on [this policy/the two (largest) policies]?"

In Waves 2A and 3A, the follow up question asks, "How much (in total) do you pay in premiums on (this policy/all these policies)?"

From Wave 5 forward, the initial question asks, "(Altogether) about how much do you pay for [this policy/these policies] each month or year?" and the follow up questions asks, "[Is this a life insurance policy that builds/Are any of these life insurance policies ones that build] up a cash value that you can borrow against, or that you would receive if the policy were to be cancelled?"

Note for any whole life insurance premiums in Wave 1, only the premium for the largest two whole life insurance policies are recorded. Also note that in Waves 2H, 3H, and 4, there are no questions about whole life insurance premiums.

## How Constructed

HwHHRES counts the number of residents in the household, including the Respondent and spouse.

Number of residents in the household for Waves 1 and 2H are derived by counting the number of people reported in the household roster. All household residents, including the Respondent and spouse, appear as observations in the HHLIST files for these waves. They are counted in preprocessing that collapses the household roster to Respondent-level observations.

In Wave 2A, household residents are identified by the HHMEMADD flag in the other-persons file and counted by household. If a household resident is married, the spouse is considered a resident as well. If the household is missing from the other-persons file, the number in the household, not including the Respondent and spouse, is taken from a direct question.

The number of residents from Wave 3 forward can be ascertained by checking the status for each person listed on the household roster. The household roster includes household residents and non-resident children but not the Respondent and spouse. The status

variable indicates whether a person is a resident or not. In Waves 3 to 5, the status variable for spouses of people on the household roster is checked for residency as well. The temporarily away status is NOT considered an indicator of residence for this variable. From Wave 6 forward, resident spouses of household members are listed as individuals on the household roster. From Wave 3 forward, the household roster is found in the HRS PR\_MC section.

Anyone with a status indicating residence is counted for the household. In Wave 2A and from Wave 3 forward, we use HwCPL to determine whether households contain a Respondent only or Respondent + spouse partner and add one or two, respectively, to the other household member count. Please see the "Whether Couple Household" for a description of the HwCPL variable.

## Cross Wave Differences in Original HRS Data

Information about household members is provided at the household-level and is given by the cover sheet Respondent at each wave.

In Waves 1 and 2H, the raw HRS data provide household resident data in a separate section with one observation per household resident. Preprocessing of Wave 1 and 2H data collapses the household resident-level observations to the household-level and then assigns them to each Respondent.

In Wave 2A, the AHEAD data provide information about household residents and children in a separate other-persons file. Additionally, in Wave 2A, a direct question asks about the number of household residents; this question is answered by the first Respondent in the household, called the cover sheet Respondent in later waves.

From Wave 3 forward, the resident and non-resident children and other household residents are found in the HRS PR\_MC section. A status variable indicates whether the individual, including a child, is a household resident or not. Household resident information is provided by the cover sheet Respondent and information about children is updated by the Family Respondent.

In Waves 1 and 2H, the Respondent and spouse are included in the household roster, along with other household members and their spouses. In Wave 2A and from Wave 3 forward, the Respondent and spouse are not included in the household roster. Couples among other household members appear on one observation in Waves 2A, 3, 4, and 5. In Wave 2A, marital status of residents indicates whether a spouse also resides in the household. From Wave 3 to Wave 5, a spouse status variable indicates whether the spouse is a resident. From Wave 6 forward, household members' spouses are included as individuals on the household roster as they were in 1992 and 1994.

In Wave 2A the direct question about the number of household residents that is asked of the cover sheet Respondent is:

"Other than you [and your (husband/wife/partner)], how many people are living with you?"

**How Constructed**

HwCHILD provides the number of living, in contact children of the Respondent and spouse or partner.

The number of living children is summed, including anyone who is a child or step-child of the Respondent or spouse. Counts of individual children are assigned to the HwCHILD variables. All of the Respondent's and spouse's living children are counted for one total. For confidentiality protection, HRS began to limit the value of this measure to a maximum so now HwCHILD=11 indicates the Respondent and spouse have 11 or more living, in contact children. For a count of biological children born to the Respondent, see RweVBRN and related variables.

In Waves 1 and 2H, living children are counted from among children in the KIDS file. In Wave 2A, living children are counted from among the children in the Other-Persons file based on relationships to the male and female members of the AHEAD couple. If a household is missing any children using this method, a direct question to the Family Respondent is used.

From Wave 3 forward, living children are counted from child status variables in the household roster. The status is checked to ensure the child is alive and in contact. The relationships to both Respondents are checked for child or step-child. Living children (in contact) of either Respondent are counted. If the status of any child is unknown, HwCHILD is set to .M. If there are no children listed in HRS PR\_MC for the household and the maximum number of children derived in prior waves is zero, then HwCHILD is set to zero.

From Wave 3 forward, there are also household-level variables that indicate the number of living, resident, and non-resident children. These may or may not agree with the count of children in the PR\_MC data. These are checked for reasonability with each other and with the number of children ever born and living at the time of interview. They are also checked for reasonability with HwCHILD derived for other waves, accounting for changes in household composition. If reasonable, these are used to fill HwCHILD when it is missing after the PR\_MC counts.

### Cross Wave Differences in Original HRS Data

In Waves 1 and 2H, the raw HRS data provide child-level data in a separate section with separate observations for each child, including in-laws. Preprocessing of Wave 1 and 2H data collapses the child-level observations to each Respondent.

In Wave 2A, the AHEAD data provide information about household residents and children in a separate other-persons file. Additionally, in Wave 2A, direct questions about the number of children are asked of the Family Respondent. The question is:

"How many (other) living children or step-children do you [or your husband/wife/partner] have?"

From Wave 3 forward, the child data needed to derive these variables can be found in the HRS PR\_MC section, for the appropriate wave. The PR\_MC data include an observation for each child, regardless of whether the child is a resident or a non-resident, and all other household residents. A status variable indicates whether an individual is a resident and whether a child is alive and in contact. There are relationship codes for both the Family and Non-Family Respondent, from which children can be identified. Beginning in Wave 6, spouses of children appear as separate observations in the PR\_MC data, and the relationship codes change and becomes more detailed. In all these waves, there are also household level variables that indicate number of living children. These may or may not agree with the count of children in the PR\_MC data.

There have been a number of data alerts for the child data for HRS 1992 and 1994. Those posted on the HRS website as of this writing have been applied to these data.

## How Constructed

RwLIVBRO and RwLIVSIB count the number of the Respondent's living brothers and sisters, respectively. RwLIVSIB is the number of the Respondent's living siblings, or the sum of RwLIVBRO and RwLIVSIB. SwLIVBRO, SwLIVSIB, and SwLIVSIB are the number of the spouse's brothers, sisters, and siblings, respectively.

In Waves 1, 2H, and from 3H forward, the number of living sisters and brothers are counted by checking status and relationship codes at each wave. In Waves 2A and 3A, these counts are taken from direct questions.

In Wave 1, a question about total number of siblings is used to fill RwLIVSIB and SwLIVSIB directly. If these are missing, the counts are used when available.

In Waves 1, 2H, 3H, 4 and 5, these data are provided by the Family Respondent. The relationship codes or variables are appropriately swapped before counting if the Respondent is not the Family Respondent. From Wave 6 forward, information on individual siblings is collected from individual Respondents.

In Waves 2A and 3A, individual Respondents are asked how many living sisters and brothers they have. In Wave 3A, Respondents are also asked how many of these sisters or brothers are step-siblings. These step-siblings are subtracted from the total number of living siblings to be compatible with other waves where step-siblings are specifically omitted.

If both parents are deceased, sibling data are not always collected unless parents were alive in a prior wave. In Wave 3H and from Wave 4 forward, if both parents are deceased, a question asks for the number of living brothers and sisters. In some cases, both a count from the sibling roster and the direct answer to this question are available and are not always the same. These derived variables use the answer to the direct question if it is available, and the number counted from the roster if it is not. Before Wave 6, the direct question is asked of the Family Respondent. From Wave 6 forward, the direct question is asked of individuals; for these waves the spouse's responses are used to provide the direct question information for siblings-in-law.

Because so many values are missing when only one wave is used, the counts are carried forward and back to help fill missing values in other waves. This filling is done for sisters and brothers separately. Counts of zero are carried forward to fill missing values in later waves, where questions may have been skipped based on no report of living siblings at a previous wave. Any non-missing count (including zero) is carried backward to fill missing values at prior waves. This may undercount living siblings, as there may have been more living at a prior wave, but it should at least give an approximation. When carrying back sibling counts for in-laws, checks are done to ensure that the spouse is the same spouse as in the source year.

The total number of siblings in RwLIVSIB and SwLIVSIB generally is calculated from the sister and brother counts after this filling is done. If either RwLIVSIB or SwLIVSIB is missing then RwLIVSIB is missing. If data on both sister and brother counts are missing, RwLIVSIB is derived from overall sibling counts when available.

## Cross Wave Differences in Original HRS Data

Information about siblings is reported in the Family Section for each wave before Wave 6. In couple households, the designated Family Respondent answers most questions about siblings, including in-laws. In Waves 2A, 3A, and from Wave 6 forward, each individual in a couple household is asked about siblings.

In Waves 1 and 2H, the raw HRS data provide sibling data in a separate section for each with separate observations for each sibling, including in-laws. Preprocessing of Wave 1 and 2H data collapses the sibling-level observations to each Respondent. When necessary, the process takes into account whether the Respondent is the Family Respondent. In Wave 2H, a status code for each sibling is provided that indicates if the sibling has died or should not have been on the list.

In Waves 2A and 3A, the AHEAD data provide information about siblings among Respondent-level data. In Wave 2A, the questions about numbers of living sisters and brothers does not include text specifically omitting step-siblings or relationship codes that distinguish between full-/half- and step-siblings. In Wave 3A, follow-up questions ask if any of the living brothers and sisters are step-siblings.

In Waves 3H, 4, and 5, the sibling data needed to derive these variables can be found in the household-level HRS Family Section and the PR\_SB section, which has one observation for each sibling-household combination. In these waves, a direct question about living siblings is asked of the Family Respondent.

From Wave 6 forward, sibling information is asked of all individuals. The PR\_SB data has one observation for each Respondent-sibling combination. A direct question asks about living siblings in these waves, which is also asked of all individuals. In Wave 7, the PR\_SB data did not include the Respondent ID, so these siblings are matched to Respondents by sub-household ID (JHHID) and Family Respondent status (JFAMR).

In the PR\_SB data, relationship codes indicate if the sibling is a sister or brother, and in waves before Wave 10, own sibling or in-law.

There have been a number of data alerts for the sibling data. Those posted on the HRS website as of this writing have been applied to these data.

 3.More children reported in 1995

### How Constructed

RAEVBRN provides the number of children ever born to the Respondent. Number of children ever born is usually only asked once and does not include step-children, adoptions or miscarriages. For confidentiality protection, HRS began to limit the value of this measure to a maximum so now RAEVBRN=11 indicates that 11 or more children were born to the Respondent. For a count of living children including biological, adoptive and step-children, see HwCHILD and related variables.

Some Respondents were asked this question in both AHEAD 1993 and AHEAD 1995. For these cases we use the response in AHEAD 1995 because the question wording is the same as subsequent waves. RAEVBRNF is a flag that identifies the Respondents that were asked this question in both AHEAD 1993 and AHEAD 1995. If RAEVBRNF = 0 then the Respondent answered in either 1993 or 1995, but not both. If RAEVBRNF = 1 then the number of children the Respondent reports in AHEAD 1993 matches the number of children they report in AHEAD 1995. If RAEVBRNF = 2 then the Respondent reported having more children in AHEAD 1993. If RAEVBRNF = 3 then the Respondent reported having more children in AHEAD 1995. And finally, if RAEVBRNF = .S then the Respondent was not in either the AHEAD 1993 or AHEAD 1995 waves.

The spouse variables SwEVBRN and SwEVBRNF are taken from the Wave "w" spouse's RAEVBRN and RAEVBRNF variables.

### Cross Wave Differences in Original HRS Data

This question is not asked in Wave 1 or 2H. In Wave 2A, the question asks "How many children have you ever had? Please don't count adopted or step-children for this question."

From Wave 3A and 3H on, the question asks "How many children have (you fathered/you given birth to)? Please don't count miscarriages or still-births, or adopted or step-children for this question."

For those that are asked this question in both Wave 2A and Wave 3A, we use the answer given in Wave 3A because the question wording is the same as subsequent waves.

## How Constructed

There are at least 2 places in every wave where Respondent could report being retired. See also "Whether retired, Retired employment status" (RwRETEMP).

RwSAYRET is derived from the question: At this time do you consider yourself to be completely retired, partly retired, or not retired at all? RwSAYRET recodes this variable to 0 for not retired, 1 for completely retired, 2 for partly retired, 3 for irrelevant, and for missing values. For proxy interviews, it is set to .S to indicate that the question was skipped.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwSAYRET.

In Wave 2A, there are no questions that ask the Respondent whether they consider themselves retired. If the Wave 2A interview is by proxy, R2SAYRET is set to .S; otherwise it is set to .Q to indicate that no information was collected for AHEAD Respondents in this wave.

See also Labor Force Status (RwLBRF, RwLBRFH, and RwLBRFY) under Employment.

## Cross Wave Differences in Original HRS Data

The question in all waves is "At this time do you consider yourself completely retired, partly retired, or not retired at all?" In Wave 1, this question is asked in the Section K: Retirement expectations. From Wave 2H forward it is asked in the Employment section, just after questions on retirement plans ("Do you plan to stop working or reduce work hours at a particular date or age, have you not

given it much thought, or what?") if Respondent is working, and after questions about the search for work if Respondent is unemployed.

One of the coded answers for this question is "Irrelevant". In Wave 1, and in Wave 2H for the self-employed and unemployed, "irrelevant" is defined as "doesn't work for pay or is homemaker; hasn't worked for 10 or more years." In Wave 2H for those employed but not self-employed, and in Waves 3H and 4, it is defined as "doesn't work for pay or is homemaker; hasn't worked for 1 or more years." From Wave 5 on it is defined just as "doesn't work for pay or is homemaker." These differences may influence the number of Respondents for whom "irrelevant" was coded.

In Wave 2A, this question is not asked at all. In Wave 3A the question is asked in the Employment section, and many cases skip the entire section because they do not work now and have not for the past 2 years. These cases are coded as .A (may be completely retired). There is no definition for the irrelevant code.

## How Constructed

Retirement month and year are derived only for Respondents who say they are completely or partially retired, i.e., where RwSAYRET is 1 or 2.

The source of retirement month and year varies across waves. In Wave 1 it is taken from the questions about retirement month and year that immediately follow an answer of considering oneself completely or partially retired. In Wave 2H, the variables for these direct retirement month and year questions are asked separately for Respondents working for a firm, self-employed, or not working. These are all examined for a non-missing retirement month and year. If retirement month and year are not available from these sources, and the Respondent reported a retired employment status then the retirement month and year given in conjunction with employment status is used.

From Wave 3H forward, a branchpoint variable indicates what the source of retirement month should be: from a previous wave, from the retired employment status month, or from the direct question. The variable derivation uses the indicated source for RwRETMON and RwRETYR.

Note that a few additional retirement months and years that are missing in RwRETMON and RwRETYR could be filled in all waves. In Wave 1, the retirement month from that given with a retired employment status could be used to fill missing values. In Wave 2H, the Wave 1 report could be carried forward, if the Respondent said they were retired in Wave 1. In Wave 3H, the retired employment status month could be used if the previous wave report is missing, and vice versa. One could look back to earlier waves as well.

In Wave 2A, there are no questions that ask the Respondent whether they consider themselves retired. To assign codes for retired the information from subsequent waves is used. If in a subsequent wave the Respondent reports being retired, the date of retirement is compared with interview date. If the interview date is after the date of retirement, R2RETMON and R2RETYR are set to the subsequent date. If R2RETMON and R2RETYR are not filled in this way, they are set to .Q to indicate that the information is not available.

The value of RwRETDTWV indicates which wave the retirement date was reported.

If Respondent says "not retired" or question is not relevant then we assign .N for "not applicable." For proxy interviews, values are set to .S to indicate question was skipped.

The spouse variables are taken from the Wave "w" spouse's self-report, i.e., from the spouse's RwRETMON and RwRETYR.

## Cross Wave Differences in Original HRS Data

In each wave there are two possible sources for retirement month, which correspond to the two places where a Respondent can report being retired. One is the retirement month and year given if the Respondent reports being retired when asked for employment status (RwRETEMP=1). The second can be asked only if the Respondent says that they are completely or partially retired (RwSAYRET=1 or 2).

In all waves, if the Respondent reports being retired when asked for employment status (RwRETEMP=1), a question asks "In what month and year did you retire?"

In Wave 1, a question asks "In what month and year did you (partly/completely) retire?" of everyone who reported being completely or partially retired (R1SAYRET=1 or 2). In Wave 2H, the question is asked only if the Respondent did not give a retired employment status, that is, if R2SAYRET is 1 or 2 and R2RETEMP is not 1. From Wave 3H forward, the group asked this question is further limited to those who did not report being completely or partially retired in a previous wave. A branchpoint variable indicates whether the source of the retirement month should be taken from the previous wave, the employment status retirement month, or the question asked in the current interview.

In Wave 2H, the series of questions on whether the Respondent considers themselves retired and the subsequent inquiry on retirement month are asked in three different places, depending on whether the Respondent is working for a firm, self-employed, or not working.

In Wave 2A, the questions were not asked. In Wave 3A, the question "What month did you retire?" is only asked if Respondent retired less than 2 years ago.

## How Constructed

There are 2 planned retirement year variables. RWRPLNYR is derived from the variable which asks Respondent about retirement plans. If Respondent plans to stop work altogether then they are asked when, which is assigned to RWRPLNYR. Most cases are missing this variable.

RWRPLNYA is an alternate variable which combines RWRPLNYR with a question which asks when Respondent thinks they will stop work or retire. In Wave 1 this question follows a question on whether Respondent considers themselves completely retired, and asks when Respondent thinks they will retire completely. From Wave 3H forward, if Respondent responds to the retirement plans question that they haven't given it much thought or has no plans, they are asked: "When do you think you will stop working?." The year given in response to this is assigned to RWRPLNYA. If Respondent did not respond in this way but did respond that they plan to stop work altogether, then RWRPLNYR is assigned to RWRPLNYA. RWRPLNYA also has many missing values, but fewer than RWRPLNYR.

The alternate question used to derive RWRPLNYA is not asked in Wave 2A or 2H, so R2RPLNYA is missing.

The years for both RWRPLNYR and RWRPLNYA can be given by age or specific year. In Wave 1 only age is given for when Respondent plans to stop work altogether and only year for when Respondent thinks they will retire. In other waves, both age and year are in the data. If the year is given by age, then year is assigned as Respondent's birth year plus the age given.

If it is a proxy interview, these questions are not asked, and RWRPLNYR and RWRPLNYA are set to .S for "skipped because proxy."

If Respondent is not working then the questions about retirement plans are not asked, except for the "when do you think you will retire completely." If the questions are skipped because Respondent is not working, RWRPLNYR and RWRPLNYA are assigned a value of .W for "not working."

Respondent can respond "Never" to the "when" questions. If Respondent says "Never" or has no plan to stop work, RWRPLNYR is set to .N. If Respondent says "Never" or was not asked the "when do you think you will stop work" question in Waves 3H forward, RWRPLNYA is set to .N.

In Wave 1 if Respondent is completely retired, then the "when do you think you will retire completely" question is not asked, and R1RPLNYA is set to .A for "already retired."

The spouse variables are taken from the wave "w" spouse's self-report, i.e., from the spouse's RWRPLNYR and RWRPLNYA.

In Wave 2A, the data needed to derive R2RPLNYR are not collected. R2RPLNYR is set to .Q to indicate that this information is not available for AHEAD Respondents in this wave.

## Cross Wave Differences in Original HRS Data

The variable of interest is the year the Respondent plans to stop working. In the employment section, the Respondent is asked about retirement plans. The question wording is almost the same across all waves. In all waves the question is preceded by a question about the usual retirement age for people the Respondent works with or with the same kind of job. It is prefaced by: "Now I have a few questions about work and retirement." Then the question is:

"Are you currently planning to stop working altogether or work fewer hours at a particular date or age, to change the kind of work you do when you reach a particular age, have you not given it much thought, or what?"

In Wave 2H, the question is:

"Are you currently planning to stop working altogether or work fewer hours at a particular date or age, have you not given it much thought, or what?"

In Wave 3A and 3H, the question is:

"Now I want to ask about your retirement plans. Do you plan to stop working altogether or work fewer hours at a particular date or age, have you not given it much thought, or what?"

In Waves 4 forward, the question is:

"Now I want to ask about your retirement plans. Do you plan to stop working altogether or reduce work hours at a particular date or age, have you not given it much thought, or what?"

In all waves multiple answers may be given: "stop work altogether," "never stop work," "haven't given it much thought," "no current plans-continue as is," "work fewer hours," "change kind of work," "work for myself," and "other." In Wave 3H another choice is added: "work until my health fails."

If Respondent plans to stop work altogether, Respondent is asked "At what age do you plan to stop working?" The questionnaire allows an age or year to be given. In Wave 1 the variable in the data is an age, but in subsequent waves either an age or year is in the data. Because multiple answers, including indefinite ones, are allowed, many cases are missing a retirement year.

Beginning in Wave 3A, if Respondent hasn't given it much thought or has no current plans, the survey asks: "At what age do you think you will stop working?" In the retirement expectations section of Wave 1 a question follows one on whether Respondent considers themselves completely retired, and asks when Respondent thinks they will retire completely. In Wave 2A there are no retirement questions asked and in 2H there is no question asking Respondent when they think they will stop working or retire.

For AHEAD Respondents in Wave 2A, the information for R2RPLNYR is not available.

1.Yes					
2.Sp not working					

## How Constructed

The question is in the retirement expectations section and asks:

"Do you expect your spouse to retire at about the same time that you do?"

R1RETWSP is simply a recode of the HRS Wave 1 variable. The possible answers are yes, no, and spouse not working. If the spouse is not working this variable is set to 2. Otherwise, it is set to 0 for no and 1 for yes.

The variable is skipped for a number of reasons. Missing codes are assigned to identify the reasons. If Respondent is completely retired, R1RETWSP is set to .A for already retired. It is set to .U if Respondent is unmarried. If retirement is irrelevant, e.g., if Respondent hasn't been working for the last 10 years or is a homemaker, R1RETWSP is set to .I for irrelevant. If the interview is by proxy, R1RETWSP is set to .S for skipped because proxy.

The spouse variable is taken from the Wave 1 spouse's self-report, i.e., from the spouse's R1RETWSP.

## How Constructed

The question is in the retirement expectations section and asks:

"Now for things that worry some people about retirement. Please tell me if they worry you a lot, somewhat, a little, or not at all: Not having enough income to get by."

R1RETINC simply recodes missings from the HRS variable. It is set to .S if the interview is by proxy, .A if the Respondent is already completely retired (R1SAYRET=1), .N if the Respondent says they will never retire to the question asking when they think they will retire.

The spouse variable is taken from the Wave 1 spouse's self-report, i.e., from the spouse's R1RETINC.

## How Constructed

The question is in the retirement expectations section and asks:

"When you [and your spouse/partner] decide to retire, do you expect your living standards to increase a lot, increase somewhat, stay about the same as now, decline somewhat, or decline a lot?"

R1RETLIV simply recodes missings from the HRS variable. It is set to .S if the interview is by proxy, .A if the Respondent is already completely retired (R1SAYRET=1), .N if the Respondent says they will never retire to the question asking when they think they will retire.

The spouse variable is taken from the Wave 1 spouse's self-report, i.e., from the spouse's R1RETLIV.

### How Constructed

The question is in the retirement expectations section and asks:

"Not counting IRA, Keogh, or any pension fund assets that you [and your spouse/partner] may have, roughly how much savings and reserve funds do you expect to have accumulated by the time you decide to retire?"

R1RETWLT simply recodes missings from the HRS variable. It is set to .S if the interview is by proxy, .A if the Respondent is already completely retired (R1SAYRET=1), .N if the Respondent says they will never retire to the question asking when they think they will retire.

The spouse variable is taken from the Wave 1 spouse's self-report, i.e., from the spouse's R1RETWLT.

## SwRETWRK: S Plan-paid work aft retired

Value	w1	w2	w3	w4	w5	w6	w7	w8	w9	w10
.D=DK	1342									
.M=Oth missing	38									
.S=Skip,proxy IW	612									
.U=Unmarried	2373									
.V=Spouse NR	379									
0.Stop work entirely	2231									
1.Continue paid work	5677									

Value	w11	w12	w13	w14	w15
.D=DK					
.M=Oth missing					
.S=Skip,proxy IW					
.U=Unmarried					
.V=Spouse NR					
0.Stop work entirely					
1.Continue paid work					

## How Constructed

The question is in the retirement expectations section and asks:

"Some people want to stop paid work entirely when they retire, while others would like to continue doing some paid work, what about you?"

R1RETWRK simply recodes the HRS variable. A "stop work entirely" response is set to 0 and "continue paid work" is set to 1. This question is skipped if the interview is by proxy. In this case R1RETWRK is set to .S. There are many "don't know" responses to this question; the questionnaire indicates that this missing value includes both "not applicable" and "don't know." There was no clear reason for a "not applicable" code.

The spouse variable is taken from the Wave 1 spouse's self-report, i.e., from the spouse's R1RETWRK.

## HRS Variables Used

HRS 1992:  
 V5032                      K26:CONT PAID WRK AT RET

<b>Self-reported probability of living to age 75</b>

## General Comments

Questions about probability of living to a given age vary between the AHEAD and HRS entry cohorts in Waves 2 and 3, due to the difference in the age of the Respondents. Thus, AHEAD Respondents are not asked about living to age 75, since most of them are close to or past that age at the first interview. So for the AHEAD entry cohort in Waves 2A and 3A, RwLIV75 and related variables (RwLIV75R, RwLIV75C, and RwLIV75F) are set to .Q to indicate that the information is not available. If an AHEAD Respondent is 75 or younger, RwLIV75P is set for them; if older than 75, RwLIV75P is set to 100.

In Waves 1, 2H, 3H, and 4, questions ask the Respondent the probability of living to age 85. In Wave 4, few of the AHEAD Respondents are young enough to be asked this question. To accommodate older Respondents, in Waves 2A, 3A, and from Wave 5 forward, the question does not always ask the probability of living to age 85, but asks the probability of living to an age from 80 to 100, depending on the Respondent's age. From Wave 5 on, the wording depends on the Respondent's age at the interview. In Waves 2A and 3A, the wording depends on birth year and is the same in both waves, even though Respondents are usually two years older in Wave 3A. So the age used to determine question wording in these waves is age in 1993.

These two different versions of the variables are named differently to alert the user to the inconsistencies in the questions. The Wave 1, 2H, 3H, and 4 variables are named RwLIV85, RwLIV85P, and RwLIV85R, while the Wave 2A, 3A, and from Wave 5 forward variables are named RwLIV10 (for 10 or so more years), RwLIV10P, and RwLIV10R. Changes in these probabilities from those given in a previous wave are used to measure change in health status in variables RwLIV75C, RwLIV85C, and R2LIV8XC. If the change uses RwLIV10R in the current or previous wave, then it is assigned to RwLIV8XC. If it uses RwLIV85R in both waves, it is assigned to RwLIV85C.

For AHEAD Respondents in Waves 2 and 3 (2A and 3A), RwLIV85, RwLIV85P, RwLIV85R, RwLIV85C, and RwLIV85F are set to .Q to indicate that this information is unavailable for this cohort in these waves. In addition, R4LIV85C and R4LIV85F are set to .Q for these cases, since the information is not available from a prior wave.

For HRS Respondents in Waves 2 and 3 (2H and 3H), RwLIV10, RwLIV10P, RwLIV10R, RwLIV8XC, and RwLIV8XF are set to .Q to indicate that these are inapplicable or unavailable for this cohort in these waves. In addition, R4LIV8XC and R4LIV8XF are set to .Q for these cases, since the prior wave information is completely based on RwLIV85 information.

## How Constructed

RwLIV75 is the Respondent's self-reported probability of living to age 75.

RwLIV75P is the implied probability from the Vital Statistics life tables that someone of the Respondent's age and gender will live to be 75. RwLIV75R is the ratio between RwLIV75 and RwLIV75P.

The life tables used are the annual life tables for the year of the wave, e.g., the 1998 life table is used to derive R4LIV75P and the 2000 life table is used to derive R5LIV75P. For Waves 3A and 3H, an alternate set of life tables, similar to those from the NCHS web page but providing estimates beyond age 85, were taken from the Berkeley Mortality Database. The probability of survival is calculated as the number surviving at age 75 divided by the number surviving to the Respondent's age, for males or females, as appropriate. SwLIV75, SwLIV75P, and SwLIV75R provide this information for the Respondent's spouse or partner.

In Wave 1 Respondent's self-reported probability is given on a 0-10 scale. This is multiplied by 10 to derive a 0-100 scale consistent with that reported in other waves.

Otherwise this variable simply recodes missing values. It is set to .S if the question is skipped because the interview is by proxy. From Wave 2H forward, it is set to .A if skipped because Respondent is older than 65. It is set to .X if the Respondent can not perform the probability question. .D means "Don't Know" and .R means the "Respondent refused to answer the question."

The spouse variable is taken from the wave "w" spouse's self-report, e.g., S3LIV75 is taken from the Wave 3 spouse's R3LIV75. Note this variable is also used to measure changes in health across waves. See the Health section of this document for the relevant variables (RwLIV75C).

This question is not asked in Wave 2A or 3A and so the variables are set to .Q.

### Cross Wave Differences in Original HRS Data

In Waves 1 and 2H, the question is asked in the Cognition section. In subsequent waves it is asked in the Expectations section.

In Wave 1, the question asks: "What do you think are the chances that you will live to be 75 or more?"

In subsequent waves, the question is: "(What is the percent chance) that you will live to be 75 or more?"

In Wave 1, the responses are on a scale of 0 to 10, with 0 meaning absolutely no chance and 10 meaning absolutely certain. In subsequent waves responses are scaled from 0 to 100.

In all waves, the question is skipped if the interview is by proxy. Beginning in Wave 2H this question is skipped if Respondent is older than age 65. This question is not asked in Waves 2A and 3A.

### HRS Variables Used

HRS 1992:	
V5115	L7:FUTR:WILL LIVE TO 75+
HRS 1994:	
W5839	C6.CHANCE LIVE TO 75
HRS 1996:	
E3819	H8. CHANCE LIVE TO 75
HRS 1998:	
F4605	H11. CHANCE LIVE TO 75
HRS 2000:	
G5018	H11. CHANCE LIVE TO 75
G514	CS1A.PROXY/SELF INTERVIEW
HRS 2002-2020:	
xA009	PROXY/SELF INTERVIEW
xP028	CHANCE R WILL LIVE TO BE AGE 75 OR MORE

<b>Self-reported probability of living to age 85</b>

## How Constructed

Please see General Comments section of "Self-Reported probability of living to age 75" for details of how this item was asked across questionnaires.

RwLIV85 is the Respondent's self-reported probability of living to age 85. For Waves 2A, 3A and from Wave 5 forward the variable measures the self-reported probability of living about another 10 years, and the name of the variables (RwLIV10) reflects this change. Except in Wave 8, for Respondents who are under 70 years old at the particular wave, RwLIV10 is the self-reported probability of living to age 80; for those 70 to 74, it is the probability of living to age 85; and so on. From Wave 8 forward, Respondents under 65 are asked about living to age 85 and those from 65 to 69 are asked about living to age 80. RwLIV10A gives the specific age used in the question, which ranges from 80 to 100, in Waves 2, 3, and Wave 5 forward. In Waves 1 and 4, the question asked about age 85 in all cases.

RwLIV85P is the implied probability from the Vital Statistics life tables that someone of the Respondent's age and gender will live to be 85. RwLIV10P is the implied probability that someone of the Respondent's age and gender will live to be the age used in the Wave 5 question. The life tables used are the annual life tables for the year of the wave, e.g., the 1998 life table is used to derive R4LIV85P and the 2000 life table is used to derive R5LIV10P. For Waves 3A and 3H, an alternate set of life tables, similar to those from the NCHS web page but providing estimates beyond age 85, were taken from the Berkeley Mortality Database. The probability of survival is calculated as the number surviving at age 85 (or 90, 95, or 100) divided by the number surviving to Respondent's age, for males or females, as appropriate.

RwLIV85R is the ratio between RwLIV85 and RwLIV85P. RwLIV10R is the ratio between RwLIV10 and RwLIV10P.

SwLIV85, SwLIV85P, SwLIV85R, SwLIV10, SwLIV10P, and SwLIV10R provide this information for the Respondent's spouse or partner.

In the question preceding the one from which these variables are derived, which asks the chances of living to age 75, if Respondent responds "absolutely no chance" (=0), this variable is set to the same. It is assumed that if the Respondent reports no chance of living to age 75 that they would report no chance of living to an older age. If the analyst needs to know the cases where RwLIV85/10 is logically imputed using RwLIV75, they can simply check RwLIV75 for a value of zero.

In Wave 1 the Respondent's self-reported probability is given on a 0-10 scale. This is multiplied by 10 to derive a 0-100 scale consistent with that reported in other waves.

Otherwise the derivation of RwLIV85 and RwLIV10 simply recodes missing values. It is set to .S if the question is skipped because the interview is by proxy. It is set to .X if the Respondent can not perform the probability question. .D means Don't Know and .R means the Respondent refused to answer the question. For Waves 2H to 4, it is set to .A if skipped because Respondent is older than 75. In Wave 5, it is set to .A if skipped because Respondent is older than 90. Note that in Wave 4, inappropriate skips (Respondent is 66 to 75) appear as other missings (.M).

RwLIV85P and RwLIV10P are calculated from the Vital Statistics life tables, using the Respondent's age and gender, as the probability of living to the target age, 85 and the age used in the Wave 2A, 3A and 5 question, given that the Respondent has lived to their current age. The calculation divides the total population at the target age by the total population at the Respondent's current age.

The derivation assigns the ratio,  $RwLIV85 / RwLIV85P$ , to RwLIV85R. It assigns the ratio,  $RwLIV10 / RwLIV10P$ , to RwLIV10R. The spouse variables are taken from the wave "w" spouse's self-report, e.g., S3LIV85 is taken from the Wave 3 spouse's R3LIV85. Note this variable is also used to measure changes in health across waves. See the Health section of this document for the relevant variables (e.g., RwLIV85C).

In Waves 2A and 3A, the data needed to derive R2LIV85, R2LIV85P, R2LIV85R, R3LIV85, R3LIV85P, and R3LIV85R are not collected. R2LIV85, R2LIV85P, R2LIV85R, R3LIV85, R3LIV85P, and R3LIV85R are set to .Q to indicate that this information is not available for AHEAD Respondents in these waves.

In Waves 2H and 3H, the data needed to derive R2LIV10, R2LIV10P, R2LIV10R, R3LIV10, R3LIV10P, and R3LIV10R are not collected. R2LIV10, R2LIV10P, R2LIV10R, R3LIV10, R3LIV10P, and R3LIV10R are set to .Q to indicate that this information is not available for HRS Respondents in these waves.

## Cross Wave Differences in Original HRS Data

In Waves 1 and 2H, the question is asked in the Cognition section. In subsequent waves it is asked in the Expectations section. It always follows a question that asks the chance that the Respondent will live to be 75 or more. If Respondent responds "absolutely no chance" to that question, this question is skipped.

In Wave 1, the question asks: And how about the chances that you will live to be 85 or more?

In Waves 2H to 4, the question is: What is the percent chance that you will live to be 85 or more?

In Waves 2A, 3A and from Wave 5 forward, the question is changed to reflect the chance that Respondent will live about another 10 years. The question wording depends on Respondent's age: "What is the percent chance that you will live to be (80, 85, 90, 95, or 100) or more?" In Waves 2A, 3A, 5, 6, and 7 if Respondent is 69 or less, it uses 80; if 70-74 it uses 85; if 75-79 it uses 90; if 80-84 it uses 95; and if 85-89 it uses 100. In Wave 8 if Respondent is under 65, it uses 85; if 65-69 it uses 80; if 70-74 it uses 85; if 75-79 it uses 90; if 80-84 it uses 95; and if 85-89 it uses 100.

In Wave 1, the responses are on a scale of 0 to 10, with 0 meaning absolutely no chance and 10 meaning absolutely certain. In

subsequent waves responses are scaled from 0 to 100.

In all waves, the question is skipped if the interview is by proxy. In Waves 2H and 3H, this question is skipped if Respondent is older than age 75. In Wave 4, the documentation indicates that the question is skipped if Respondent is older than age 75, but in the data it appears that the question is skipped if Respondent is older than 65. In Wave 2A, 3A and 5, this question is skipped if Respondent is 90 or older.

For AHEAD Respondents in Waves 2A and 3A, the information for R2LIV85, R2LIV85P, R2LIV85R, R3LIV85, R3LIV85P, and R3LIV85R are not available.

For HRS Respondents in Waves 2H and 3H, the information for R2LIV10, R2LIV10P, R2LIV10R, R3LIV10, R3LIV10P, and R3LIV10R are not available.

## General Comments

Questions about probability of living to a given age vary between the AHEAD and HRS entry cohorts in Waves 2 and 3, due to the difference in the age of the Respondents. Thus AHEAD Respondents are not asked about living to age 75, since most of them are close to or past that age at the first interview. So for the AHEAD entry cohort in Waves 2A and 3A, RwLIV75 and related variables (RwLIV75R, RwLIV75C, and RwLIV75F) are set to .Q to indicate that the information is not available. If an AHEAD Respondent is 75 or younger, RwLIV75P is set for them; if older than 75, RwLIV75P is set to 100.

In Waves 1, 2H, 3H, and 4 questions ask the Respondent the probability of living to age 85. In Wave 4, few of the AHEAD Respondents are young enough to be asked this question. To accommodate older Respondents, in Waves 2A, 3A, and from Wave 5 forward the question does not always ask the probability of living to age 85, but asks the probability of living to an age from 80 to 100, depending on the Respondent's age. From Wave 5 on, the wording depends on the Respondent's age at the interview. In Waves 2A and 3A, the wording depends on birth year and is the same in both waves, even though Respondents are usually two years older in Wave 3A. So the age used to determine question wording, in these waves, is age in 1993.

These two different versions of the variables are named differently to alert the user to the inconsistencies in the questions. The Wave 1, 2H, 3H, and 4 variables are named RwLIV85, RwLIV85P, and RwLIV85R, while the Wave 2A, 3A, and from Wave 5 forward variables are named RwLIV10 (for 10 or so more years), RwLIV10P, and RwLIV10R. Changes in these probabilities from those given in a previous wave are used to measure change in health status in variables RwLIV75C, RwLIV85C, and R2LIV8XC. If the change uses RwLIV10R in the current or previous wave, then it is assigned to RwLIV8XC. If it uses RwLIV85R in both waves, it is assigned to RwLIV85C.

For AHEAD Respondents in Waves 2 and 3 (2A and 3A), RwLIV85, RwLIV85P, RwLIV85R, RwLIV85C, and RwLIV85F are

set to .Q to indicate that this information is unavailable for this cohort in these waves. In addition R4LIV85C and R4LIV85F are set to .Q for these cases, since the information is not available from a prior wave.

For HRS Respondents in Waves 2 and 3 (2H and 3H), RwLIV10, RwLIV10P, RwLIV10R, RwLIV8XC, and RwLIV8XF are set to .Q to indicate that these are inapplicable or unavailable for this cohort in these waves. In addition R4LIV8XC and R4LIV8XF are set to .Q for these cases, since the prior wave information is completely based on RwLIV85 information.

## How Constructed

The change in health measures were chosen for their consistency across waves. They include measures of overall health, functional limitation summaries, doctor-diagnosed health conditions, and assessment of mortality measures.

They are calculated as the current wave less the previous interview measures. If Respondent missed an interview due to non-response, the change is between the current and the last interview that Respondent did respond to. A flag for each change variable indicates how many interviews were missed prior to the current.

For further discussion of the Change in Health variables see the section titled "Health Change" in the introductory section of this document.

RwLIV75C, RwLIV85C, and RwLIV8XC measure changes in the Respondent's self-reported probability of living to age 75, 85, and an age from 80 to 100, respectively, relative to the probabilities implied by Vital Statistics life tables.

At all waves except Waves 2A and 3A, questions ask the Respondent the probability of living to age 75. In Waves 1, 2H, 3H, and 4, questions also ask the Respondent the probability of living to age 85. For Wave 2A, 3A and from Wave 5 forward the question asks the self-reported probability of living about another 10 years, and the name of the variables (RwLIV10) reflects this change. For Respondents who are under 70 years old at the particular wave, RwLIV10 is the self-reported probability of living to age 80; for those 70 to 74, it is the probability of living to age 85; and so on. In Wave 8, the target age for those under 65 years old is 85.

Based on the Respondent's age and gender, a standard probability of living to 75 and 85, or, in Waves 2A, 3A, and from Wave 5 on, the target age in the question, is derived from the Vital Statistics life tables. RwLIV75R, RwLIV85R (for waves 1, 2H, 3H, and 4) and RwLIV10R (for Waves 2A, 3A, and 5) are the ratios between the self-reported and standard probability, and are derived as the self-report divided by the standard. The change variables are RwLIV75C, RwLIV85C, and RwLIV8XC. RwLIV85C is used when the change is measured between two RwLIV85R variables, and RwLIV8XC is used when the change measure uses any RwLIV10R variable in its derivation. The variables are derived as:

$$\text{RwLIV75C} = \text{RwLIV75R} - \text{RpLIV75R}$$

$$\text{RwLIV85C} = \text{RwLIV85R} - \text{RpLIV85R}, \text{ when both } w \text{ and } p \text{ are Wave 1, 2H, 3H, or 4}$$

$$\text{RwLIV8XC} = \text{RwLIV10R} - \text{RpLIV85R}, \text{ when } w \text{ is Wave 2A, 3A, or 5 and } p \text{ is Wave 1, 2H, 3H, or 4}$$

$$\text{RwLIV8XC} = \text{RwLIV10R} - \text{RpLIV10R}, \text{ when both } w \text{ and } p \text{ are Wave 2A, 3A or 5}$$

$$\text{RwLIV8XC} = \text{RwLIV85R} - \text{RpLIV10R}, \text{ when } w \text{ is Wave 4 and } p \text{ is Wave 2A or 3A}$$

where "w" means current wave and "p" means the previous interview. For example, if an individual responded to Waves 2H and 3H, R3LIV75C = R3LIV75R - R2LIV75R. Because of the wording difference in Waves 2A, 3A, and 5, the change measure RwLIV8XC is not very consistent and perhaps not useful.

Not all individuals respond to every interview. Respondents may miss one or more interviews between those they complete. RwLIV75F, RwLIV85F, and RwLIV8XF indicate if there are any missed interviews prior to the current, and if so, how many. In other words, they indicate how far back the previous interview is, from which the change is measured. Their codes are: 0) did not miss the previous interview; change = current - [current-1]; 1) missed the previous interview, but only one; change = current -

[current-2]; 2) missed the two previous interviews; change = current - [current-3]; 3) missed the three previous interviews; change = current - [current-4], and so on. If either the current or previous interview measure is missing, change is missing and the flag is set to .M.

For AHEAD entry cohort Respondents in Waves 2 and 3 (2A and 3A), R4LIV75C, R4LIV75F, R4LIV85C, and R4LIV85F are set to .Q to indicate that the information is not available for these Respondents. R4LIV75C, R4LIV75F, R4LIV85C, and R4LIV85F are also set to .Q, since there is no prior wave R4LIV85R available to derive these in Wave 4.

For HRS entry cohort Respondents in Waves 2 and 3 (2H and 3H), R4LIV8XC and R4LIV8XF are set to .Q to indicate that the information is not applicable for these Respondents. R4LIV8XC and R4LIV8XF are also set to .Q, since for these Respondents no prior wave R4LIV10R variable is available. R4LIV85C and R4LIV85F variables are available instead.

R4LIV75C, R4LIV85C, R4LIV75F, R4LIV85F, and R4LIV8XF are this information for the Respondent's spouse or partner. The spouse variables are taken from the Wave "w" spouse's self-reported information, e.g., R3LIV75C is taken from the Wave 3 spouse's R3LIV75C.

Please see the section on "Self-reported probability of living to age 75" and "Self-reported probability of living to age 85" in Section J, "Retirement Plans, Expectations" for a description of the variables from which this change variable is derived.

### **Cross Wave Differences in Original HRS Data**

Please see the documentation of the variables used to derive these change-in-health variables for a description of cross-wave differences in the raw HRS data.

## How Constructed

In these questions Respondent is asked to choose between pairs of jobs where one guarantees current family income and the other offers a chance to increase income but also carries the risk of loss of income. If Respondent says they would take the risk, the same scenario but with riskier odds is presented. If Respondent says they would not take the risk, the same scenario with less risky odds is asked.

In Wave 1, the pair of jobs presented are a hypothetical current job and a new one. From Wave 4 forward, the pair of jobs presented are both new jobs, given that Respondent will need to move and find a new job. These questions are not asked in Waves 2 and 3.

The variable RWRISK is set using the following four levels, listed from least to most risk-averse:

1. Respondent would take a job with even chances of doubling income or cutting it in half.
2. Respondent would take a job with even chances of doubling income or cutting it by a third.
3. Respondent would take a job with even chances of doubling income or cutting it 20%.
4. Respondent would take or stay in the job that guaranteed current income given any of the above alternatives.

From Waves 4 forward, additional questions are asked that allow two more categories:

- 1a. Less risk-averse than 1 above: Respondent would take a job with even chances of doubling income or cutting it by 75%.
- 4a. Between categories 3 and 4 above: Respondent would take a job with even chances of doubling income or cutting it by 10%.

These additional categories are used to derive RWRISK6. To allow comparison with Wave 1, RWRISK6 is recoded to the 4-category RWRISK variable. Respondents in category 1a are considered least risk-averse and those in 3a are considered most risk-averse in RWRISK. Thus codes 1 and 2 in RWRISK6 variable correspond to 1, codes 5 and 6 in RWRISK6 correspond to 4, and, codes 3 and 4 in RWRISK6 correspond to 2 and 3, respectively, in RWRISK.

These questions are not asked if the interview is by proxy. RWRISK and RWRISK6 are set to .S for proxy interviews.

From Wave 4 forward, Respondents are selected to answer these questions or not, based on a combination of their cohort, age, and/or random selection. Please see the "Cross-Wave Differences" for the variations across waves. If Respondent is not asked these questions by interview design, then RWRISK and RWRISK6 are set to .A, .B, or .C if skipped because of age, random selection, or cohort, respectively.

The spouse variable is taken from the Wave 1 spouse's self-report, i.e., from the spouse's R1RISK.

## Cross Wave Differences in Original HRS Data

In wave 1 the question wording is: "Suppose that you are the only income earner in the family, and you have a good job guaranteed to give you your current (family) income every year for life. You are given the opportunity to take a new and equally good job, with a 50-50 chance it will double your (family) income and a 50-50 chance that it will cut your (family) income by a third. Would you take the new job?"

If yes, then: "Suppose the chances were 50-50 that it would double your (family) income, and 50-50 that it would cut it in half. Would you still take the new job?"

If no, then: "Suppose the chances were 50-50 that it would double your (family) income and 50-50 that it would cut it by 20 percent. Would you then take the new job?"

In Waves 2 and 3, these questions are not asked.

From Wave 4 forward the question wording is: "Suppose that you are the only income earner in the family. Your doctor recommends that you move because of allergies, and you have to choose between two possible jobs. The first would guarantee your current total family income for life. The second is possibly better paying, but the income is also less certain. There is a 50-50 chance the second job would double your total lifetime income and a 50-50 chance that it would cut it by a third. Which job would you take – the first job or the second job?"

If first job is chosen in the first question, then: "Suppose the chances were 50-50 that the second job would double your lifetime income and 50-50 that it would cut it by twenty percent. Would you take the first job or the second job?"

If first job is chosen in the second question again, then: "Suppose the chances were 50-50 that the second job would double your lifetime income and 50-50 that it would cut it by 10 percent. Would you take the first job or the second job?"

If second job is chosen in the first question, then: "Suppose the chances were 50-50 that the second job would double your lifetime income, and 50-50 that it would cut it in half. Would you take the first job or the second job?"

If second job is chosen in the second question again, then: "Suppose the chances were 50-50 that the second job would double your lifetime income and 50-50 that it would cut it by seventy-five percent. Would you take the first job or the second job?"

In all waves these questions are skipped if the interview is by proxy. Otherwise the sample asked these questions varies across waves.

In Wave 1, all self-reporting Respondents are asked these questions.

In Wave 4, AHEAD cohort Respondents are not asked, but all self-reporting CODA and War Babies Respondents are, along with all new HRS cohort spouses. One of ten HRS cohort Respondents is also randomly selected for these questions.

In Wave 5, the questionnaire indicates that Respondents are selected based on whether they were asked the question in 1998 and their experimental module assignment in 1996, in addition to random selection among those under 65. But the criteria involving 1998 and 1996 does not appear to be accurate, nor is the selection based on age. It appears instead that one of twelve Respondents is randomly selected for these questions, regardless of age. All entry cohort subsamples are eligible for selection.

In Waves 6 and 8 if person is 65 or older the questions are skipped. Otherwise, all other self-reporting Respondents are asked these questions.

In Wave 7 only the new EBB cohort is asked the questions.

In Wave 9 and forward, these questions are not asked.

## How Constructed

RwFINPLN is derived from the question: In planning your family's saving and spending, which time period is most important to you? RwFINPLN simply recodes missings from the HRS variable. It is set to .S if skipped because the interview is by proxy.

In Waves 4 and 5, Respondents are selected to answer this question or not, based on a combination of their cohort and random selection. If Respondent is not asked this question by interview design, then RwFINPLN is set to .B or .C, indicating selection based on random selection or cohort, respectively.

In Waves 6 and, this question generally is not asked if Respondent is 65 or older. If skipped due to Respondent's age, RwFINPLN is set to .A.

In Waves 11 forward, Respondents who had difficulty with the first few probabilities in the Expectations module skip these questions and are coded as .X (see RwANS3PQ variable).

In Wave 12, some Respondents were skipped if they were not a new Respondent. In these cases, RwFINPLN is set to .P, indicating the Respondent had responded in a previous wave.

Beginning Wave 13, the question is only asked to new Respondents on alternative waves. For Respondents from previous waves who were not asked the question, RwFINPLN is set to .P.

The spouse variable is taken from the Wave "w" spouse's self-report, i.e., from the spouse's RwFINPLN.

## Cross Wave Differences in Original HRS Data

In all waves, this question is skipped if the interview is by proxy. Otherwise the sample asked this question varies across waves.

In Wave 1, all self-reporting Respondents are asked this question.

In Waves 2 and 3, these questions are not asked.

In Wave 4, AHEAD cohort Respondents are not asked, but all self-reporting CODA and War Babies Respondents are, along with all new HRS cohort spouses. One of ten HRS cohort Respondents is also randomly selected for these questions.

In Wave 5, the questionnaire indicates that Respondents are selected based on whether they were asked the question in 1998 and their experimental module assignment in 1996, in addition to random selection among those under 65. But the criteria involving 1998 and 1996 does not appear to be accurate, nor is the selection based on age. It appears instead that one of twelve Respondents is randomly

selected for these questions, regardless of age. All entry cohort subsamples are eligible for selection.

In Wave 6, the questions are skipped if person is 65 or older. Otherwise, all other self-reporting Respondents are asked this question.

In Waves 7 and 8, all Respondents are asked this question.

In Waves 9 and 10, this question is not asked.

In Wave 11, this question generally is asked of self-reporting Respondents under age 65 who were able to answer the first three probability questions in the Expectations module.

In Wave 12, this question is asked of most self-reporting Respondents who were able to answer the first three probability questions in the Expectations module. In some cases, this question was skipped for Respondents who appeared in earlier waves.

Beginning Wave 13, the question is only asked to new self-reporting Respondents on alternative waves. The respondents must also have been able to answer the first three probability questions in the Expectations module to be asked the question.

## How Constructed

In Wave 3A and from Wave 4 onwards, in the Expectations section, Respondents are asked a series of probability questions. They are asked how likely a certain scenario is and reports a probability (0-100).

If Respondent responds don't know or refused to answer the first three probability questions, then the rest of the section is skipped. RwANS3PQ is set to "1" if the Respondent successfully responded to at least the first three probability question and "0" if not. If the Respondent skipped the entire section then RwANS3PQ is set to .M. It is set to .S if skipped because the interview is by proxy.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwANS3PQ.

## Cross Wave Differences in Original HRS Data

In Wave 1, 2 and 3H the questions are not asked.

In Wave 3A we use the three questions specified in the questionnaire to determine if Respondent answered the probability questions. In Waves 4 to 8, we simply re-code a raw HRS variable that tells us if Respondent responded to the first three probability questions.

In Wave 9 and beyond, we use two counts to calculate if Respondent responded to the first three probability questions. This first is a count of the number of questions the Respondent was asked and the second is a count of the number of questions the Respondent reported don't know or refused.

In Wave 3H, the values are set to .Q, to indicate that no information is available.

**How Constructed**

This question is not asked in Wave 1, 2A or 3A. From Wave 2H forward, Respondent's self-reported probability is given on a 0-100 scale. RWINHER simply recodes missing values. It is set to .S if the question is skipped because the interview is by proxy.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RWINHER.

In Waves 2A and 3A, the data needed to derive R2INHER and R3INHER are not collected. R2INHER and R3INHER are set to .Q to indicate that this information is not available for AHEAD Respondents in these waves.

From Wave 9 forward, the data is not collected and so the variable is dropped for these waves.

## Cross Wave Differences in Original HRS Data

The question is not asked in Wave 1, 2A or 3A. In Wave 2H it is asked in the Cognition section. From Wave 3H forward, it is asked in the Expectations section.

Through Wave 7, the question asks: "And how about the chances that you will receive an inheritance within the next 10 years?"

In Wave 8, the question changes, particularly for those in a couple household. It is: "(Not counting anything you might give or leave to each other,) what are the chances that you (or your [husband/wife/partner])will receive an inheritance during the next 10 years?"

For AHEAD Respondents in Waves 2A and 3A, the information for R2INHER and R3INHER are not available.

From Wave 9 forward, this question is not asked.

## HRS Variables Used

HRS 1994:	
W5845	C11.CHANCE RECEIVE INHER
HRS 1996:	
E3827	H12.RECEIVE INHERIT.
HRS 1998:	
F4576	H3. RECEIVE INHERIT.
HRS 2000:	
G4989	H3. RCV INHERIT
G514	CS1A.PROXY/SELF INTERVIEW
HRS 2002-2006:	
xA009	PROXY/SELF INTERVIEW
xP008	WILL R RECEIVE ANY INHERITANCE NEXT 10YR

<b>Self-reported probability of leaving a bequest</b>

5.No,definitely					

## How Constructed

In Wave 1, Respondent is asked to rate on a 5-point scale whether they expect to leave a "large" bequest. The HRS variable is simply recoded for missings. Beginning in Wave 2, Respondent is asked to give the probability that they will leave a bequest of \$10,000 or more. If the probability is greater than zero, they are asked for the probability of leaving a bequest of \$100,000 or more. If that probability is greater than zero, beginning in Wave 6, they are asked for the probability of leaving a bequest of \$500,000 or more.

In Wave 3H, and from Wave 4 forward an additional question is asked if Respondent gives a zero probability to the first question. Respondent is asked for the probability of leaving any bequest.

In Wave 2A and 3A, Respondent is asked for the probability of leaving any bequest before being asked the subsequent 10K and 100K questions.

In Wave 2A and from Wave 3 forward, probabilities are given on a 0-100 scale. They are simply recoded for missings, and set to .S if the interview is by proxy. If Respondent reports a 0 probability of leaving a \$10,000 bequest then RwBEQ100 is set to zero. If Respondent reports a non-zero probability of leaving a \$10,000 request, the "any" bequest variable in waves 3H and from Wave 4 forward is skipped. In this case, RwBEQANY is set to .Y (skipped/asked 10K) unless it is 100 percent chance.

In Waves 2A and 3A, if Respondent reports a zero probability of leaving an "any" bequest variable then the 10K and 100K questions are skipped. In these cases RwBEQ10K and RwBEQ100 are set to zero.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's R1BEQLRG, RwBEQ10K, RwBEQ100, RwBEQ500 and RwBEQANY.

In Wave 2H, the data needed to derive R2BEQANY are not collected. R2BEQANY is set to .Q to indicate that this information is not available for HRS Respondents in this wave.

### **Cross Wave Differences in Original HRS Data**

In Wave 1 the question is at the end of Section M (Net worth other than housing) and asks: "Do you [and your (spouse/partner)] expect to leave a sizeable inheritance to your heirs?" The answers are given in a 5-point scale from 1=Yes, definitely to 5=No, definitely not.

In Wave 2H two questions are asked in the Cognition section:

- 1) "And what are the chances that you [or your (husband/wife/partner)] will leave an inheritance totalling \$10,000 or more?"
- 2) "What are the chances that you [or your (husband/wife/partner)] will leave an inheritance totalling \$100,000 or more."

Answers are given as a 0-100 probability. The second question is skipped if the answer to the first is 0=absolutely no chance.

In Wave 3H the same two questions are asked in the Expectations section, and if Respondent responds "absolutely no chance" to the first, another is asked:

- 3) "What are the chances that you (and your (spouse/partner)) will leave any inheritance?"

In Wave 2A and 3A three questions are asked in the Expectations section:

- 1) "What are the chances that you [or your (husband/wife/partner)] will leave any inheritance?"
- 2) "And what are the chances that you [or your (husband/wife/partner)] will leave an inheritance totalling \$10,000 or more?"
- 3) "What are the chances that you [or your (husband/wife/partner)] will leave an inheritance totalling \$100,000 or more?"

Answers are given as a 0-100 probability. The second or third question is skipped if the answer to the previous is 0=absolutely no chance or .S. The third question is also skipped if probability given to the second question is 30 percent or less.

From Wave 4 to Wave 7, the questions are also asked in the Expectations section, and the first question wording is slightly different:

- 1) "Including property and other valuables that you might own, what are the chances that you [and your (husband/wife/partner)]

will leave an inheritance totalling \$10,000 or more?"

From Wave 6 forward, an additional question is asked:

"What are the chances that you [or your (husband/wife/partner)] will leave an inheritance totalling \$500,000 or more?"

From Wave 8 forward, the question is prefaced by the following:

"Think about an inheritance you (and your (husband/wife/partner) might leave (but not including any inheritance you might leave to each other)."

In Waves 4 to 7, the second and third questions are the same as in Wave 3H. From Wave 8 forward, the second and third questions are the same, except that they are prefaced by the word "And."

From Wave 2 forward, these questions are skipped if the interview is by proxy.

For HRS Respondents in Wave 2H, the information for R2BEQANY is not available.

## HRS Variables Used

## How Constructed

In Wave 1 the Respondent's self-reported probability of working full-time after age 62 is given on a 0-10 scale. This is multiplied by 10 to derive a 0-100 scale consistent with that reported in other waves.

If the Respondent answers "absolutely no chance" to a previous question about the chances of working in the future, the probability of working full-time after age 62 question is skipped but we set it to zero and the logical imputation flag RwWORK62F is set to 1.

Otherwise this variable simply recodes missing values.

RwWORK62 is set to .A if skipped because Respondent is already age 62. Note that the HRS documentation indicates that this question is asked of 62-year olds in Waves 4 to 6, but many of these cases are coded 996-already 62. In these waves RwWORK62 is set to .A if age is over 62 or if age 62 with code 996. It is set to .W if the question is skipped because Respondent is not working, and to .S if skipped because the interview is by proxy. It is set to .X if the Respondent cannot perform the probability question. .D means Don't Know and .R means the Respondent refused to answer the question. If the HRS variable contains a valid probability it is assigned regardless of the Respondent's age, work status, or proxy status.

Respondents who had difficulty with the first few probabilities in the expectations module skip these questions and are coded as .X.

In Wave 2A and 3A, there are no comparable questions and so for AHEAD Respondents, the values are set to .Q, to indicate that no information is available.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwWORK62.

### **Cross Wave Differences in Original HRS Data**

In Wave 1, the question is in the Employment section and asks: "Thinking about work generally and not just your present job, what do you think are the chances that you will be working full-time after you reach age 62?" It is skipped if Respondent is not currently working for pay.

In Wave 2H, the question is in the Cognition section and is skipped if the Respondent is not working for pay and says that there is no chance they will work for pay in the future. The question wording is the same as in Wave 1 if Respondent is currently working or believes they may work in the future. The phrase "Think about work generally and not just your present job" is dropped if Respondent is not working.

From Wave 3H forward, the question is asked in the Expectations section and the "Think about . . ." phrase is dropped if Respondent is self-employed. From Wave 3H to Wave 7, the question is skipped if Respondent is not currently working for pay. From Wave 8, the question is asked whether Respondent is working or not.

From Wave 2H forward, the question is skipped if the interview is by proxy. If Respondent answers "absolutely no chance" to a previous question about the chances of working in the future the question is also skipped.

From Waves 2H, 3H, and from Wave 7 forward, it is skipped if the Respondent is age 62 or older. In Waves 4 to 6, it is asked if the Respondent is age 62 and skipped if older than 62. For many of the age 62 Respondents in these waves the code 996 indicates that they are already 62.

In Wave 1, the answers range from 0=absolutely no chance to 10=absolutely certain. From Wave 2H forward, the answers range from 0=absolutely no chance to 100=absolutely certain.

In Wave 2A and 3A, there are no comparable questions and for AHEAD Respondents, the values are set to .Q, to indicate that no information is available.

In Wave 8, 722 Respondents reported zero to the probability of working in the future but then were asked the probability of working at age 62 in error. 710 reported zero to the probability of working until age 62. Therefore, the logical skip flag was not set for these cases. This accounts for the low means in R8WORK62F.

In Wave 9, 1400 Respondents are given an opportunity to change their response if they said there was a 0 or 100 percent probability they would be working at age 62. These follow-on questions ask if the Respondent is certain their answer is accurate and if not, asks for another estimate. We do not include these amended answers in RwWORK62 but these variables are available on the 2008 RAND HRS Fat File and the skip pattern can be found in the questionnaire on the HRS website.

In Wave 10, 3599 Respondents are given an opportunity to change their answer. The selection process is more complicated but again, we do not use this data in R10WORK62. These variables are available on the 2010 RAND HRS Fat Files and the skip pattern can be found in the questionnaire on the HRS website. So it is possible for someone to be missing RwWORK62 but have a value in RwWORK65 due to changing their answer and getting asked the probability of working at age 65 question.

In Wave 11, the questionnaire reverts back to the questions asked in Wave 8. There is no opportunity to change an answer and the skip logic is applied correctly so the flag (R11WORK62F) is in line with other waves.

In Wave 15, due to a skip pattern error, some Respondents were not asked the R15WORK62 question and the subsequent probability of work questions. This results in a larger amount of .M missings in this wave.

1.No chance of future work		1472	1284	1465	1068	860

## How Constructed

In Wave 1 the Respondent's self-reported probability of working full-time after age 65 is given on a 0-10 scale. This is multiplied by 10 to derive a 0-100 scale consistent with that reported in other waves.

If the Respondent answers "absolutely no chance" to a previous question about the chances of working in the future, the probability of working full-time after age 65 question is skipped but we set it to zero and the logical imputation flag RwWORK65F is set to 1.

If the Respondent reports 0 probability of working full-time after age 62 then the probability of working full-time after age 65 is also set to zero and the logical imputation flag RwWORK65F is set to 1. Otherwise this variable simply recodes missing values.

RwWORK65 is set to .A if skipped because Respondent is already age 65. It is set to .W if skipped because Respondent is not working, and to .S if skipped because the interview is by proxy. It is set to .X if the Respondent cannot perform the probability question. .D means "Don't Know" and .R means the "Respondent refused to answer the question." If the HRS variable contains a valid probability it is assigned regardless of the Respondent's age, work status, or proxy status.

Note that most 62-65 year-olds have missing values for this variable from Wave 2 through Wave 6. This is because of discrepancies

between the skip patterns as described in the documentation and those actually found in the data.

In Wave 2A and 3A, there are no comparable questions and so for AHEAD Respondents, the values are set to .Q, to indicate that no information is available.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwWORK65.

## Cross Wave Differences in Original HRS Data

In Wave 1, the question is in the Employment section. In Wave 2H it is in the Cognitions section, and thereafter it is in the Expectations section. In all waves, it is preceded by one asking the chances of working after age 62 and has the same wording. The question asks: "And what about the chances that you will be working full-time after you reach age 65?" In all waves it is skipped if Respondent responds "absolutely no chance" to the preceding age 62 question.

In Wave 1 and from Wave 3H to Wave 7, the question is skipped if Respondent is not currently working for pay. In Wave 2H, it is skipped if the Respondent is not working for pay and answers "absolutely no chance" to a previous question about the chances of working in the future. In Wave 8 it is asked whether Respondent is working or not. From Wave 2H forward it is skipped if the interview is by proxy.

From Wave 2H forward, the question is skipped if Respondent answers "absolutely no chance" to a previous question about the chances of working in the future. The documentation indicates that question is skipped if the Respondent is already age 65. However it appears from the data that most Respondents age 63 or older in Wave 2H skip this question. From Wave 3H to Wave 6 it appears that most Respondents age 62 or older skip this question, that is, most Respondents who skipped the preceding age 62 question also skip this one. This appears to have been corrected in Wave 7.

In Wave 1, the answers range from 0=absolutely no chance to 10=absolutely certain. From Wave 2H forward, the answers range from 0=absolutely no chance to 100=absolutely certain.

In Wave 2A and 3A, there are no comparable questions and so for AHEAD Respondents, the values are set to .Q, to indicate that no information is available.

In Wave 15, due to various skip pattern errors, some Respondents were not asked the R15WORK65 question and the subsequent probability of work questions. This results in a larger amount of .M missings in this wave. In early interview months (March, April, and May 2020 especially), Respondents erroneously skipped this question if they were ages 62-64 or if they were currently working for pay.

## How Constructed

RwWORK70 is the self-reported probability of working full time after age 70. RwWORK70A is the self-reported probability of working at all after age 70. RwWORK70F and RwWORK70AF are their logical skip flags, respectively. SwWORK70, SwWORK70A, SwWORK70F, and SwWORK70AF provide the information for the Respondent's spouse or partner. These variables are available beginning in Wave 11.

If the Respondent answers "absolutely no chance" to a previous question about the chances of working in the future, the probability of working full-time (RwWORK70) or at all (RwWORK70A) after age 70 questions are skipped but we set them to zero and the logical imputation flags RwWORK70F and RwWORK70AF are set to 1.

If the Respondent reports 0 probability of working full-time after age 62 or 65 or at all after 70, then the probability of working full-time after age 70 (RwWORK70) is also set to zero and the logical imputation flag RwWORK70F is set to 1. Otherwise this variable simply recodes missing values.

RwWORK70 and RwWORK70A are set to .A if skipped because Respondent is already age 70. They are set to .S if skipped because the interview is by proxy. They are set to .X if the Respondent cannot perform the probability question. .D means "Don't Know" and .R means the "Respondent refused to answer the question." If the HRS variable contains a valid probability it is assigned regardless of the Respondent's age, work status, or proxy status.

The spouse variables are taken from the wave "w" spouse's self-report, i.e., from the spouse's RwWORK70, RwWORK70A, RwWORK70F, RwWORK70AF.

## Cross Wave Differences in Original HRS Data

These questions are not available prior to Wave 11.

The Respondent is asked, "What are the chances that you will be doing any work for pay after you reach age 70?"

If the respondent provides a valid number over 0, the Respondent is then asked, "Thinking about work in general and not just your present job, what do you think the chances are that you will be working full-time after you reach age 70?"

The questions are skipped if the Respondent answers "absolutely no chance" to a previous question about the chances of working in the future. The questions are preceded by two asking the chances of working full time after age 62 and 65. The RwWORK70 question is skipped if Respondent responds "absolutely no chance" to the preceding age 62, 65, or work at all at 70 questions.

The questions are also skipped if the interview is by proxy or if the Respondent is already age 70.

The answers range from 0=absolutely no chance to 100=absolutely certain.

In Wave 15, due to various skip pattern errors, some Respondents were not asked the R15WORK65 question and the subsequent probability of work questions, including R15WORK70 and R15WORK70A. This results in a larger amount of .M missings in this wave. In early interview months (March, April, and May 2020 especially), Respondents erroneously skipped these questions if they were ages 62-64 or if they were currently working for pay.

## HRS Variables Used

S5WORKLM	4533	41.92	27.59	0.0	100.0
S6WORKLM	3809	42.22	27.71	0.0	100.0

### How Constructed

In Wave 1, Respondent's self-reported probability of health limiting work is given on a 0-10 scale. This is multiplied by 10 to derive a 0-100 scale consistent with that reported in other waves.

Otherwise this variable simply recodes missing values.

If Respondent's health already limits their work then this variable is set to .A. It is set to .W if skipped because Respondent is not working, and to .S if skipped because the interview is by proxy. If the HRS variable contains a valid probability it is assigned regardless of the Respondent's work or proxy status.

In Wave 2A and 3A, there are no comparable questions and so for AHEAD Respondents, the values are set to .Q, to indicate that no information is available.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwWORKLM.

The question is not asked from Wave 7 and forward.

## Cross Wave Differences in Original HRS Data

In Wave 1, the question is in the Employment section. In Wave 2H it is in the Cognitions section, and thereafter it is in the Expectations section. The question is not asked from Wave 7 forward. The question wording is the same across all waves:

"What about the chances that your health will limit your work activity during the next 10 years?"

In Wave 1 and from Wave 3H forward, the question is skipped if Respondent is not currently working for pay. In Wave 2H, it is skipped if the Respondent is not working for pay and answers "absolutely no chance" to a previous question about the chances of working in the future. From Wave 2H forward it is skipped if the interview is by proxy.

In Wave 1, the answers range from 0=absolutely no chance to 10=absolutely certain. From Wave 2H forward, the answers range from 0=absolutely no chance to 100=absolutely certain. The Respondent may also indicate that a health problem already limits work.

In Wave 2A and 3A, there are no comparable questions and so for AHEAD Respondents, the values are set to .Q, to indicate that no information is available.

## How Constructed

RwPNHM5Y is the Respondent's self-reported probability of moving to nursing home in next 5 years. From Wave 4 forward, the question is only asked among those 65 and older.

SwPNHM5Y provides this information for the Respondent's spouse or partner.

RwPNHM5Y simply recodes for missing values. It is set to .N if skipped because Respondent is currently in nursing home. It is set to .S if the question is skipped because the interview is by proxy. It is set to .A if skipped because Respondent is younger than 65. It is set to .X if the Respondent can not perform the probability question. .D means Don't Know and .R means the Respondent refused to answer the question.

The spouse variable is taken from the wave "w" spouse's self-report.

Because this question is not asked or asked of the different samples in Waves 1 to 3, the measure is not included for these earlier waves at this time.

## Cross Wave Differences in Original HRS Data

The question asks: "What is the percent chance that you will move to a nursing home in the next five years?" It is only asked among those aged 65 and older. For some of those younger than 65 who are not re-interviews, an alternate question wording asks for the probability of ever moving to a nursing home. This variable does NOT include answers to the alternate question asked of younger Respondents.

The question is not asked if Respondent is currently in nursing home, the interview is by proxy and if Respondent is younger than age 65.

This question is not asked at all in Wave 1, and is asked of varying samples in Waves 2 and 3. In Waves 2A and 3A it is asked of everyone. In Wave 2H it is asked of those 60 and older, and in Wave 3H it is asked of those 70 and older. The alternate question wording asked of younger Respondents appears in Wave 3H for those 60 to 69 years old.

## How Constructed

RwRETSAT is the Respondent's self-report of retirement satisfaction. The question is asked if the Respondent is completely retired. SwRETSAT provides the information for the Respondent's spouse or partner.

RwRETSAT simply recodes for missing values. It is set to .N if Respondent is not retired. It is set to .I if the question is irrelevant because Respondent has not worked relatively recently. These cases correspond to those where RwSAYRET is coded 3.Question irrelevant. It is set to .S if the question is skipped because the interview is by proxy. In Wave 3A, when R3SAYRET is .A for probably retired, R3RETSAT is set to .I, and if the question is skipped because Respondent retired more than two years ago, it is set to .X.

The spouse variable is taken from the wave "w" spouse's self-report. If Respondent is not married, SwRETSAT is set to .U=unmarried. If Respondent's spouse did not respond then these are set to .V=Spouse is non-response.

Because this question is not asked in Wave 2A, the measure is not included at this time.

## Cross Wave Differences in Original HRS Data

For all waves, the question is: "All in all, would you say that your retirement has turned out to be very satisfying, moderately satisfying, or not at all satisfying?"

The question is asked of everyone who says they are completely retired in RwsAYRET and where the interview is not by proxy. In Wave 3A, the question is also skipped if Respondent retired more than two years ago.

This question is not asked in Wave 2A.

## How Constructed

RwRYRCMP is the Respondent's comparison of retirement years to the time just before retirement. The question is asked if the Respondent is completely retired. SwRYRCMP provides this information for the Respondent's spouse or partner.

RwRYRCMP recodes for missing values. It is set to .N if Respondent is not completely retired. It is set to .I if the question is irrelevant because Respondent has not worked relatively recently. These cases correspond to those where RwSAYRET is coded 3.Question irrelevant. RwRYRCMP is set to .S if the question is skipped because the interview is by proxy. It is set to .Y if Respondent retired less than one year ago.

In later waves, RwRYRCMP is set to .W if Respondent has not reported working in the previous two waves of data.

In Wave 2A this question is not asked and the value is set to .Q. In Wave 3A, when R3SAYRET is .A for probably retired, R3RYRCMP is set to .I, and if the question is skipped because Respondent retired more than two years ago, it is set to .X.

The spouse variable is taken from the wave "w" spouse's self-report. If Respondent is not married, SwRYRCMP is set to .U=unmarried. If Respondent's spouse did not respond then these are set to .V=Spouse.

## Cross Wave Differences in Original HRS Data

In all waves this question is skipped if the interview is by proxy. Otherwise the sample asked this question varies across waves.

In Waves 1-3, all self-reporting, fully retired Respondents are asked this question.

In Wave 4, AHEAD cohort Respondents are not asked, but all self-reporting CODA and War Babies Respondents are, along with all new HRS cohort spouses. One of ten HRS cohort Respondents is also randomly selected for these questions.

In Wave 5, the questionnaire indicates that Respondents are selected based on whether they were asked the question in 1998 and their experimental module assignment in 1996, in addition to random selection among those under 65. But the criteria involving 1998 and 1996 does not appear to be accurate, nor is the selection based on age. It appears instead that one of twelve Respondents is randomly selected for these questions, regardless of age. All entry cohort subsamples are eligible for selection.

In Wave 6 if person is 65 or older the questions are skipped. Otherwise, all other self-reporting retired Respondents are asked this question.

In Waves 7 and forward, Respondents are skipped if they are not completely retired or if they have not reported working in the previous two waves of data.

## How Constructed

RwWORK is derived from the question: "Are you currently working for pay?" It simply recodes this variable to a yes/no indicator and for missing values. In some waves a response of working but not for pay is allowed. This is treated as NOT working for pay.

RwWORK2 indicates whether the Respondent is working at a second job. If RwWORK is set to "0", then RwWORK2 is also "0" (No).

In Wave 1 the source variable for RwWORK is imputed in the HRS data. The imputation is not used, if imputed RwWORK is

set to missing.

In Wave 2A, there is no question about a second job. So for the AHEAD Respondents, R2WORK2 is set to the .Q SAS special missing value, to indicate that no information is available.

In Wave 3A, RwWORK is also derived from the employment status question: "Are you working now, temporarily laid off, unemployed and looking for work, disabled and unable to work, retired, a homemaker, or what?" If there is no information in the question: "Are you currently working for pay?" and the Respondent reports "Working now" as employment status, then RwWORK is set to "1" (Yes).

The spouse variables are taken from the wave "w" spouse's self-report, i.e., from the spouse's RwWORK and RwWORK2.

## Cross Wave Differences in Original HRS Data

The questions about working for pay and working a second job are the same across waves. The questions ask:

"Are you doing any work for pay at the present time?"

"Are you doing any other work for pay now, such as (another) business of your own, a second job or the military reserves?"

In Wave 1 the first question may have a response of "working but not for pay."

## HRS Variables Used

HRS 1992:	
V12717	F2:ANY WRK FOR PAY :IND
V2717	F2:ANY WRK FOR PAY :IMP

## How Constructed

RwSLFEMP is derived from the question: "Do you work for someone else, are you self-employed, or what?" regarding the current main job. The possible responses are someone else or self-employed. According to the HRS documentation, Respondents who said they ran their own businesses were recoded to self-employed. RwSLFEMP simply recodes this variable to a yes/no indicator and for missing values. If this question was skipped because the Respondent isn't working for pay, RwSLFEMP is set to SAS special missing value (.W).

There are some cases where RwWORK indicates that the Respondent is not working, but that have a value for whether the Respondent is self-employed. If a valid value is available for the self-employment question, it is used. In particular, from Wave 3H forward, this question is asked of Respondents who reported being temporarily laid off, or on sick or other leave who also said they intend to return to the same job, even if they are not currently working for pay. Respondents in this situation may have a value for RwSLFEMP.

In Wave 1 the source variable for RwSLFEMP is imputed in the HRS data. The imputation is not used, if imputed RwSLFEMP is set to missing.

The spouse variables are taken from the wave "w" spouse's self-report, i.e., from the spouse's RwSLFEMP.

## Cross Wave Differences in Original HRS Data

The core of the question about whether working for a firm or oneself is the same across waves. The question asks:

"Do you work for someone else, are you self-employed, or what?"

In Waves 1, 2 and 3A, it is only asked of Respondents who are currently working for pay and is prefaced by:

"Next are some questions about your current, main job."

In Wave 3H and from Wave 4 forward, if the Respondent is currently working for pay, the question is prefaced by:

"On your current (main) job, ..."

For these waves, it is also asked of Respondents who report being temporarily laid off or on leave, if they also say they expect to go back to this job, in which case the question is prefaced by:

"On the job you plan to go back to, ..."

## HRS Variables Used

HRS 1992:

V12717	F2:ANY WRK FOR PAY	:IND
V12718	F3:WHO WORK FOR	:IND
V2717	F2:ANY WRK FOR PAY	:IMP
V2718	F3:WHO WORK FOR	:IMP

AHEAD 1993:

## How Constructed

RwSAMEMP is 1 if the Respondent reports working for the same employer as the previous wave. If the Respondent is self-employed in both the current and previous wave, RwSAMEMP is also 1. If this is the Respondents first interview, RwSAMEMP=.P. If the Respondent is not working, RwSAMEMP=.W.

This variable is derived from the question in the Employment section:

"STILL WORKING PREV EMPLOYER According to our records, in [Previous Wave Month] [Previous Wave Year] you were [working for [Prev Wave Old Employer Name]/someone else]. Are you still working [there/for that same employer]?"

RwSAMEJOB is 1 if the Respondent reports having the same job as the previous interview. If this is the Respondents first interview, RwSAMEJOB=.P. If the Respondent is not working, RwSAMEJOB=.W.

Until Wave 12, if the Respondent reports being self-employed in the current wave and the previous wave, RwSAMEJOB=1. From Wave 12, an additional question is asked about if the business has changed. If the Respondent reports the business has changed from the previous wave, RwSAMEJOB=0.

This variable is derived from the following questions in the Employment Section:

"SAME JOB TITLE AS PREVIOUS WAVE [In [Prev IW Month] [Prev IW Year] our records indicate that your job title was [Prev Wave Job Title]. Is this still the case? / Is your job title still the same as it was in [Prev IW Month] [Prev IW Year]?]"

"WORK FOR SOMEONE ELSE/SLF-EMPLOYED According to our records, in [Prev Wave IW Month] [Prev Wave IW Year] you were self-employed. Do you have the same business that you had in [Prev Wave IW Month] [Prev Wave IW Year] or is it a different business?"

The spouse variables are taken from the wave "w" spouse's self-report, i.e., from the spouse's RwSAMEMP and RwSAMEJOB.

## Cross Wave Differences in Original HRS Data

1995 Ahead does not ask the question about having the same job title as last wave so we set R3SAMEJOB = .Q.

In Wave 8 a number Respondents were not asked the question about same job title, if they reported working for the same employer as the last wave. We set R8SAMEJOB=.Q for these cases. This was part of an experimental skip pattern that was not repeated in subsequent waves.

## HRS Variables Used

AHEAD 1993:	
B1174	G1. WORKING CURRENTLY?
HRS 1994:	
W3316	FA2.WORKING FOR PAY
W3458	FA19.STILL WORKING FOR W
W3502	FA21.SAME JOB TITLE AS W
AHEAD 1995:	
D2747	GA19. STILL WORKING SAME EMPLOYER
HRS 1996:	
E2627	G2.WORKING FOR PAY
E2654	G19A.STILL WORKNG FOR PREV WAVE EMPLOYER
E2655	G19B.STILL WORKING PREV EMPLOYER
E2662	G21.SAME JOB TITLE AS PREVIOUS WAVE

HRS 1998:  
F3131 G2.WORKING FOR PAY  
F3158 G19A.STILL WORKING FOR PREV WAVE EMPLOYE  
F3166 G19B.STILL WORKING PREV EMPLOYER  
F3183 G21.SAME JOB TITLE AS PREVIOUS WAVE  
HRS 2000:  
G3381 G2.WORKING FOR PAY  
G3416 G19B.STILL WORKING PREV EMPLOYER  
G3432 G21.SAME JOB TITLE AS PREVIOUS WAVE  
HRS 2002-2020:  
xJ020 WORKING FOR PAY  
xJ045 STILL WORKING PREV EMPLOYER  
xJ058 SAME JOB TITLE AS PREVIOUS WAVE  
HRS 2014-2020:  
xJ958 WORK FOR SOMEONE ELSE/SLF-EMPLOYED

## How Constructed

RwLBRF summarizes the labor force status for the Respondent at each wave as working full-time, working part-time, unemployed, partly retired, retired, disabled, or not in the labor force. SwLBRF summarizes the labor force status for the Respondent's spouse or partner.

The derivation uses many different questions that are available each wave. A Respondent can give evidence of working, being retired, and disability alone or in combination with other statuses. RwLBRF attempts to pull information from several sources, and sort through the discrepancies.

If the Respondent is working full-time, RwLBRF is set to this status. If they are working part-time and mentions retirement, RwLBRF is set to partly retired. If there is no mention of retirement, RwLBRF is set to working part-time.

If the Respondent is not working but is looking for a job, RwLBRF is set to unemployed. If the Respondent is not looking for a job and there is any mention of retirement, RwLBRF is set to retired. If retirement is not mentioned and a disabled employment status is given, RwLBRF is set to disabled. Otherwise, RwLBRF is set to "not in the labor force."

Working 35+ hours per week, 36+ weeks per year is considered full-time. Less than this is considered part-time. The hours and weeks from both the main and second job are considered in determining whether the Respondent is working full-time or part-time. In Wave 2A, there are no questions about a second job, so for the AHEAD Respondents, the hours and weeks from the main job only are considered.

A mention of retirement can be made either through the employment status or the questions that ask the Respondent whether they consider themselves retired. Please see descriptions of RwSAYRET and RwRETEMP in the Retirement Plans and Expectations section.

Specific questions ask about whether the Respondent is looking for a full-time or part-time job.

In Wave 2A, there are neither questions about employment status nor the questions that ask the Respondent whether they consider themselves retired, nor are there questions that ask about whether the Respondent is looking for a full-time or part-time job. So for the AHEAD Respondents, it is only possible to assign working full-time and working part-time codes in R2LBRF based on information from Wave 2A. To assign other codes for unemployed, retired and disabled, the information from subsequent waves is used.

If in a subsequent wave the Respondent reports being unemployed, retired or disabled, the date of unemployment, retirement or disability is compared with interview date. If the interview date is after the date of unemployment, retirement or disability, R2LBRF is set to the appropriate status.

If no information from a subsequent wave is used, then additional codes are assigned for AHEAD Respondents for R2LBRF. If the Respondent is not working now, but has worked in the last two years, a SAS special missing code of .T is assigned.

If the Respondent is not working now, and has not worked in the prior two years, but is over 65 years old, the SAS missing code .A is assigned. The analyst may want to assume these cases are retired. If the Respondent is not working now, and has not worked in the prior two years, and is not over 65 years old the code .Q is assigned, as the employment status was not asked.

There are some cases where the unemployment variable (RwUNEMP) does not match the Labor force variable (RwLBRF). This is due to slight coding differences. The Respondent must say they are looking for work to be considered to be unemployed in RwLBRF. It is not enough to mention being unemployed in the employment status variables. Whereas, a mention of being unemployed in the employment status variables will result in RwUNEMP being set to 1.Yes.

SwLBRF is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwLBRF.

RwLBRFH also summarizes the labor force status for the Respondent at each wave using the same sources. However, this variable invokes no week restriction where working 35+ hours per week is considered full-time employment, and working between 1 and 34 hours per week is considered part-time. SwLBRFH is taken from the wave "w" Spouse's self-report, i.e., from the Spouse's RwLBRFH.

For Respondents who have a labor force status classification of full-time or part-time in RwLBRFH, RwLBRFY indicates year-round and part-year employment. RwLBRFY flags Respondents working 50+ weeks per year as year-round employment, and working fewer than 50 weeks per year as part-year employment. SwLBRFY is taken from the wave "w" Spouse's self-report, i.e., from the Spouse's RwLBRFY.

## **Cross Wave Differences in Original HRS Data**

Labor force status uses many pieces of employment data: whether working for pay, employment status, whether considers one's self retired, usual hours worked per week, usual weeks worked per year, second job, hours per week and weeks per year on second job, and whether looking for work.

These pieces are available in all waves, except Wave 2A. The wording for all of these questions is the same or similar across all waves where available. For more details please see RwWORK and RwWORK2 under "Currently working for pay" and RwJHOURS and RwJHOUR2 under "Hours worked per week" in this section (Employment), and RwSAYRET under "Considers self retired," and RwRETEMP under "Retired Employment Status" in the Retirement Plans and Expectations Section.

The questions about usual hours and weeks worked per year are asked of working Respondents each wave. In all but Wave 2A these questions are asked about the second job, if any. In Wave 2A these questions are asked about the main job only.

The question about looking for work is asked of Respondents who are not working. This question is asked in all waves except Wave 2A.

Though the wording of these questions is similar across waves, the navigation through the survey instrument and skip patterns vary quite a bit for some of these variables.

## How Constructed

RwINLBRF is an indicator for whether the Respondent is considered part of the labor force as defined by the Bureau of Labor Statistics (BLS). Briefly, this definition considers those who are working for pay, or those who are not working but actively seeking work as part of the labor force.

SwINLBRF is an indicator for whether the Respondent's spouse is considered part of the labor force.

The derivation uses questions about current work status, work for pay, and activities related to job seeking. Institutionalized Respondents (i.e. those in a nursing home) are not included in the derivation.

If the Respondent is working for pay, RwINLBRF is set to "in the labor force." If the Respondent is not working for pay, but reports actively looking for a job in the last four weeks, RwINLBRF is set to "in the labor force." If the Respondent is neither working for pay nor looking for work and reports being retired, disabled, or a homemaker as their current job status, RwINLBRF is set to "not in the labor force."

In Wave 2A, there are neither questions about employment status nor questions that ask the Respondent whether they consider themselves retired, neither are there questions that ask about whether the Respondent is looking for work. So for the AHEAD Respondents, it is only possible to determine whether the Respondent was working for pay or not. If the Respondent is not working for pay, it cannot be determined if the person is looking for work based on information from Wave 2A. To further determine labor force status, the unemployment, retirement and disability status information from subsequent waves is used.

If in a subsequent wave the Respondent reports being unemployed, retired or disabled, the date of unemployment, retirement or disability is compared with interview date. If the interview date is after the date of unemployment, retirement or disability, R2INLBRF is set to the appropriate status.

If no information from subsequent waves is used, then additional codes are assigned for the AHEAD Respondents for R2INLBRF. If the Respondent is not working now, but has worked in the last two years, a SAS special missing code of .T is assigned.

If the Respondent is not working now, and has not worked in the prior two years, but is over 65 years old, the SAS missing code .A is assigned. The analyst may want to assume these cases are retired. If the Respondent is not working now, has not worked in the prior two years, and is not over 65 years old the code .Q is assigned, as the employment status was not asked.

SwINLBRF is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwinLBRF.

## Cross Wave Differences in Original HRS Data

Labor force status uses several pieces of employment data: whether working for pay, current job status, and whether looking for work.

These pieces are available in all waves, except Wave 2A. The wording for all of these questions is the same or similar across all waves where available.

The question about current job status is asked in all waves except Wave 2A.

The question about looking for work is asked of Respondents who are not working. This question is asked in all waves except Wave 2A.

Though the wording of these questions is similar across waves, the navigation through the survey instrument and skip patterns vary quite a bit for some of these variables.

## How Constructed

There are at least 2 places in every wave where the Respondent could report being retired. See also "Whether retired, Consider self retired" (RwSAYRET).

RwRETEMP is derived from employment status. The Respondent can report a retired status alone or in addition to other statuses, such as working, disabled, or unemployed. RwRETEMP is set to 1 if the Respondent only reports a retired status, or 2 if the Respondent reports being retired in addition to another status. It is set to 0 if no retirement status is reported at all. In Wave 2H, if the interview is a proxy for a deceased Respondent, it is set to SAS special missing code .S to indicate that the question was skipped. In Wave 2A, the question is not asked at all.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwRETEMP.

In Wave 2A, employment status is not asked, for AHEAD Respondents R2RETEMP is set to SAS special missing code .Q to indicate that the information is not available.

See also Labor Force Status (RwLBRF and SwLBRF).

## Cross Wave Differences in Original HRS Data

In Wave 2H, employment status is not asked if the Respondent is deceased. Only Wave 2H includes proxy interviews for deceased Respondents. In Wave 2A, this question is not asked at all.

## How Constructed

RwUNEMP is an indicator for whether the Respondent is considered unemployed as defined by the Bureau of Labor Statistics (BLS). Briefly, this definition considers those who are not working but actively seeking work as unemployed. SwUNEMP is an indicator for whether the Respondent's spouse is considered unemployed.

The derivation uses questions about current work status, work for pay, and activities related to job seeking. Institutionalized Respondents (i.e. those in a nursing home) are not included in the derivation.

If the Respondent is working for pay, then RwUNEMP is set to employed.

If the Respondent is not working for pay and also reports actively looking for a job in the last four weeks, RwUNEMP is set to unemployed. If the Respondent is not working for pay but considered "not in the labor force" according to RwINLBRF, then the special missing code .X is assigned to RwUNEMP. See RwINLBRF in this section for more details.

In Wave 2A, there are neither questions about employment status nor are there questions that ask the Respondent whether they consider themselves retired, nor do the questions ask about whether the Respondent is looking for work. So for the AHEAD Respondents, it is only possible to determine whether the Respondent was working for pay or not. If the Respondent is not working for pay, it cannot be determined if the person is looking for work based on information from Wave 2A. To further determine unemployment status for Wave 2A, unemployment status information from subsequent waves is used.

If in a subsequent wave the Respondent reports being unemployed, the date of unemployment is compared with the interview date. If the interview date is after the date of unemployment, R2UNEMP is set to unemployed.

If no information from a subsequent wave is used, then additional codes are assigned for the AHEAD Respondents for R2UNEMP. If the Respondent is not working now, but has worked in the last two years, a SAS special missing code of .T is assigned.

If the Respondent is not working now, and has not worked in the prior two years, but is over 65 years old, the SAS missing code .A is assigned. The analyst may want to assume these cases are retired. If the Respondent is not working now, has not worked in the prior two years, and is not over 65 years old, the code .Q is assigned, as the employment status was not asked.

SwUNEMP is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwUNEMP.

## Cross Wave Differences in Original HRS Data

Unemployment status uses several pieces of employment data: whether working for pay, current job status, and whether looking for work.

These pieces are available in all waves, except Wave 2A. The wording for all of these questions is the same or similar across all waves where available.

The question about current job status is asked in all waves except Wave 2A.

The question about looking for work is asked of Respondents who are not working. This question is asked in all waves except Wave 2A.

Though the wording of these questions is similar across waves, the navigation through the survey instrument and skip patterns vary quite a bit for some of these variables.

## How Constructed

RwJHOURS is the usual number of hours per week the Respondent works at their main job. RwJHOUR2 is the usual number of hours per week the Respondent works at a second job.

If the Respondent is working for pay then they are asked how many hours per week they usually work at the main job. RwJHOURS recodes missings for this variable. If the Respondent is not working it is set to a .W missing code.

RwJHOUR2 recodes missings for usual number of hours worked at a second job, if any. If the Respondent is not working a second job it is set to a .W missing code.

In Wave 2A, there was no question about a second job. So for AHEAD Respondents, R2JHOUR2 is set to the .Q SAS special missing value, to indicate that no information is available.

The spouse variables are taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJHOURS and RwJHOUR2.

## Cross Wave Differences in Original HRS Data

Usual hours of work per week is asked of working Respondents at every wave. The question wording remains the same across waves and asks:

If the Respondent works for a firm: "How many hours a week do you usually work on this job?"

If the Respondent is self-employed: "How many hours a week do you usually work in this business?"

For a second job: "How many hours a week do you usually work on (this other job/these other jobs)?"

In all waves, it is not asked if the Respondent is not working.

In Waves 1, 2H and 3A, the question about the main job is asked separately and appears in different variables, depending on whether the Respondent is self-employed or not. In Waves 2H and 3A, the question about the second job is also asked separately, based on the Respondent's self-employment status. From Wave 3H forward, the question wording about the main job varies depending on the Respondent's self-employment status, but the result appears in the same variable.

## How Constructed

RwJWEEKS is the usual number of weeks per year the Respondent works at their main job, counting paid vacation as weeks worked. RwJHOUR2 is the usual number of hours per week the Respondent works at a second job.

If the Respondent is working for pay then they are asked how many weeks per year they usually work at the main job. RwJWEEKS recodes missings for this variable. If the Respondent is not working, it is set to a .W missing code.

RwJWEEK2 recodes missings for usual number of weeks worked at a second job, if any. If the Respondent is not working a second job it is set to a .W missing code.

In Wave 2A, there was no question about a second job. So for the AHEAD Respondents, R2JWEEK2 is set to the .Q SAS special missing value, to indicate that no information is available.

The spouse variables are taken from the Wave "w" spouse's self-reports, i.e., from the Wave "w" spouse's RwJWEEKS and RwJWEEK2.

## Cross Wave Differences in Original HRS Data

Usual number of weeks worked per year is asked of working Respondent at each wave. The question wording remains the same across waves and asks:

"Main job: Counting paid vacations as weeks of work, how many weeks a year do you usually work on this job?"

"If second job(s): Counting paid vacations as weeks of work, how many weeks a year do you usually work on (this other job/these other jobs)?"

In all waves, it is not asked if the Respondent is not working.

In Waves 1, 2H and 3A, the question about the main job is asked separately and appears in different variables, depending on whether the Respondent is self-employed or not. In Waves 2H and 3A, the question about the second job is also asked separately based on the Respondent's self-employment status. From Wave 3H forward, the question wording about the main job varies depending on the Respondent's self-employment status, but the result appears in the same variable.

## How Constructed

RwWGIHR is the Respondent's hourly wage rate, and RwWGIWK is the weekly wage rate.

If the Respondent is working at an interview, they are asked how much the job pays. Usual hours per week and weeks per year are also asked. The rate of pay can be reported for various periods, e.g., per hour, per week, or per year. Weekly and hourly wage rates are calculated using the usual hours worked per week, usual weeks worked per year, and the pay rate, adjusting appropriately for the periodicity of pay reported. These variables are given as gross wages.

The wage rates are left in nominal dollars. If the Respondent is working, but is missing the wage rate for the current job, the wage rate is left as missing.

For those who are unemployed, a wage rate is imputed. The imputation method is described in more detail in the "Conceptual Variables: Wages" section earlier in this document, and uses the wage rate for the most recent job, if available. If no previous wage rate is available for an unemployed Respondent, it is imputed using predicted values from regression results. Imputations are only used for unemployed persons (RwLBRF=3). If a person is not working but does not have RwLBRF=3, or is working but missing wages, no imputations are done.

The wage rate for the most recent job held before a given interview is calculated using all available reports on past jobs. This includes job history information, reports on previous interview jobs that end, and jobs that begin and end between interviews. Hourly and weekly rates are both calculated, using the same methods used to calculate the current wage rate. The most recent non-missing wage rate is then adjusted to current wave dollars. For example, if the most recent wage rate at the 1994 interview is from 1991, then the wage rate is adjusted to 1994 dollars using CPI-U.

The RwWGIHR and RwWGIWK variables include reported hourly and weekly wages for the currently employed and imputed hourly and weekly wages for the unemployed. The RwWGFHR and RwWGFWK variables are flags that indicate whether and how the wage rates are imputed.

If the Respondent is not working then we assign SAS special missing code .W for "not working."

The spouse variables are taken from the wave "w" spouse's self-report, i.e., from the spouse's RwWGIHR, RwWGIWK, RwWGFHR, and RwWGFWK.

## Cross Wave Differences in Original HRS Data

The variables used to calculate the hourly and weekly wage rate are usual hours worked per week, usual weeks worked per year, and a pay rate. Usual hours and usual weeks are asked in all waves, and the question wording is the same across waves. The questions about pay vary in the number of places the questions are asked.

In Wave 1, the current job pay is asked if the Respondent is working. If the Respondent is not working, questions ask if they have ever worked, and if so, ask for the usual hours worked, usual weeks worked, and pay rate at the time they left the last job. If the job ended more than 20 years ago, the pay question is skipped. Whether the Respondent is working or not, information about past jobs can be obtained, including hours worked per week, weeks worked per year, and earnings in the last year with the most recent past employer.

In Wave 2A, the current job pay is asked if the Respondent is working. If the Respondent is not working, questions ask if they did work for pay in the last two years, and if so, ask for the usual hours worked, usual weeks worked, and pay rate at the time they left the last job. If the Respondent is not working or has not worked for the last two years, no questions about any other past jobs are asked.

In Wave 3A, the current job pay is asked. If the Respondent's work status or employer has changed since the last interview, questions are asked about earnings at the time they left the previous job. Even if it is the Respondent's first interview, no questions about other past jobs are asked.

In Wave 2H and Wave 3H and in subsequent interviews, the current job pay is asked. If the Respondent's work status or employer has changed since the last interview, questions are asked about earnings at the time they left the previous job. There are also questions that ask about jobs that both began and ended between the prior and current interviews. These questions obtain the hours worked per week and earnings. In addition, if it is the Respondent's first interview, information is collected about past jobs, using questions similar to those described for Wave 1.

These variables are self-reported and inconsistent values do exist in the data. For example, in Wave 2H HHIDPN=45923020 reports working 8 hours per week but reports working 40 hours per week in Wave 1 and Wave 3H. Also, in Wave 12, HHIDPN=139756010 reported an annual salary of \$225,000 (OJ188) and annual business profits of \$500,000 (OJ195). But they only report working one week (OJ179) for three hours (OJ172). This value is causing large outliers in R12WGIHR, S12WGIHR, R12WGIWK and S12WGIWK. In Wave 13, HHIDPN=544738010 reports an hourly wage of \$62,000 and HHIDPN=902894010 reports an hourly wage of \$39,033. These values are causing large outliers in R13WGIHR, S13WGIHR, R13WGIWK and S13WGIWK.

## How Constructed

RwJPHYS indicates the extent to which the Respondent says their job requires lots of physical effort.

RwJPHYS simply recodes missing values to SAS missing codes. If the question is skipped because the Respondent is not working, it is set to .W for not working. With the exclusion of Wave 6, the question is usually skipped if the Respondent is working at the same job. If skipped, and the Respondent reported working at the prior interview, then the prior interview value is used.

In Wave 2A, there was no question about physical effort at a job. So for the AHEAD Respondents, R2JPHYS is set to the .Q SAS special missing value, to indicate that no information is available.

Note that this question is not asked in any proxy interviews, but in many of these cases the prior interview report is used. Proxies for which this variable remains missing are set to .S.

If the value from a prior interview is used but is missing because the question wasn't asked or the interview was by proxy, then the current wave variable is set to .P, information from prior interview is missing.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJPHYS.

## Cross Wave Differences in Original HRS Data

Each wave working Respondents are asked a number of questions about the job's characteristics. The question wording is the same across waves and asks:

"I'll read some statements that are true for some people's jobs but not for other people's jobs. Thinking of your job, please tell how often these statements are true.

My job requires lots of physical effort.

Is this true all or almost all of the time, most of the time, some of the time, or none or almost none of the time?"

In Wave 2A this question was not asked.

In Wave 3A the question is asked separately and appears in different variables, depending on whether the Respondent is self-employed or not.

In Wave 2H and from Wave 3 forward, if the Respondent is working for the same employer and has the same job title as in the previous interview, this question is skipped.

If the interview is by proxy this question is skipped and coded as .S. If no information was available from a prior interview because it was a proxy or Wave 2A, it will be coded as .P.

From Wave 9, a category with value 5 was added to represent "Does Not Apply."

## How Constructed

RwJLIFT indicates the extent to which the Respondent says their job requires lifting heavy loads.

RwJLIFT simply recodes missing values to SAS missing codes. If the question is skipped because the Respondent is not working, it is set to .W for not working. With the exclusion of Wave 6, the question is usually skipped if the Respondent is working at the same job. If skipped, and the Respondent reported working at the prior interview, then the prior interview value is used.

In Wave 2A, there was no question about lifting heavy loads at a job. So for the AHEAD Respondents, R2JLIFT is set to the .Q SAS special missing value, to indicate that no information is available.

Note that this question is not asked in any proxy interviews, but in many of these cases the prior interview report is used. Proxies for which this variable remains missing are set to .S.

If the value from a prior interview is used but is missing because the question wasn't asked or the interview was by proxy, then the current wave variable is set to .P, information from prior interview is missing.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJLIFT.

## Cross Wave Differences in Original HRS Data

Each wave working Respondents are asked a number of questions about the job's characteristics. The question wording is the same across waves and asks:

"I'll read some statements that are true for some people's jobs but not for other people's jobs. Thinking of your job, please tell how often these statements are true.

My job requires lifting heavy loads.

Is this true all or almost all of the time, most of the time, some of the time, or none or almost none of the time?"

In Wave 2A this question was not asked.

In Wave 3A the question is asked separately and appears in different variables, depending on whether the Respondent is self-employed or not.

In Wave 2H and from Wave 3 forward, if the Respondent is working for the same employer and has the same job title as in the previous interview, this question is skipped.

If the interview is by proxy this question is skipped and coded as .S. If no information was available from a prior interview because it was a proxy or Wave 2A, it will be coded as .P.

From Wave 9, a category with value 5 was added to represent "Does Not Apply."

## How Constructed

RwJSTOOP indicates the extent to which the Respondent says their job requires stooping, kneeling, or crouching.

RwJSTOOP simply recodes missing values to SAS missing codes. If the question is skipped because the Respondent is not working, it is set to .W for not working. With the exclusion of Wave 6, the question is usually skipped if the Respondent is working at the same job. If skipped, and the Respondent reported working at the prior interview, then the prior interview value is used.

In Wave 2A, there was no question about stooping, kneeling, or crouching at a job. So for the AHEAD Respondents, R2JSTOOP is set to the .Q SAS special missing value, to indicate that no information is available.

Note that this question is not asked in any proxy interviews, but in many of these cases the prior interview report is used. Proxies for which this variable remains missing are set to .S.

If the value from a prior interview is used but is missing because the question wasn't asked or the interview was by proxy, then the current wave variable is set to .P, information from prior interview is missing.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJSTOOP.

## Cross Wave Differences in Original HRS Data

Each wave working Respondents are asked a number of questions about the job's characteristics. The question wording is the same across waves and asks:

"I'll read some statements that are true for some people's jobs but not for other people's jobs. Thinking of your job, please tell how often these statements are true.

My job requires stooping, kneeling, or crouching.

Is this true all or almost all of the time, most of the time, some of the time, or none or almost none of the time?"

In Wave 2A this question was not asked.

In Wave 3A the question is asked separately and appears in different variables, depending on whether the Respondent is self-employed or not.

In Wave 2H and from Wave 3 forward, if the Respondent is working for the same employer and has the same job title as in the previous interview, this question is skipped.

If the interview is by proxy this question is skipped and coded as .S. If no information was available from a prior interview because it was a proxy or Wave 2A, it will be coded as .P.

From Wave 9, a category with value 5 was added to represent "Does Not Apply."

## How Constructed

RwJSIGHT indicates the extent to which the Respondent says their job requires good eyesight.

RwJSIGHT simply recodes missing values to SAS missing codes. If the question is skipped because the Respondent is not working, it is set to .W for not working. With the exclusion of Wave 6, the question is usually skipped if the Respondent is working at the same job. If skipped, and the Respondent reported working at the prior interview, then the prior interview value is used.

Note that this question is not asked in any proxy interviews, but in many of these cases the prior interview report is used. Proxies for which this variable remains missing are set to .S.

If the value from a prior interview is used but is missing because the question wasn't asked or the interview was by proxy then the current wave variable is set to .P, information from prior interview is missing.

In Wave 2A, there are only three levels of response as opposed to the four in other waves. The response categories are set to correspond to those with the same wording in other waves. The omitted level in Wave 2A is "All or almost all of the time."

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJSIGHT.

## Cross Wave Differences in Original HRS Data

Each wave working Respondents are asked a number of questions about the job's characteristics. The question wording is the same across waves and asks:

"I'll read some statements that are true for some people's jobs but not for other people's jobs. Thinking of your job, please tell how often these statements are true.

My job requires good eyesight.

Is this true all or almost all of the time, most of the time, some of the time, or none or almost none of the time?"

In Wave 2A, the second part of the question was slightly different:

"Is this true most of the time, some of the time, or hardly ever?"

So for AHEAD Respondents, R2JSIGHT has no code one ("All or almost all of the time").

In Wave 3A the question is asked separately and appears in different variables, depending on whether the Respondent is self-employed or not.

In Wave 2H and from Wave 3 forward, if the Respondent is working for the same employer and has the same job title as in the previous interview, this question is skipped.

If the interview is by proxy this question is skipped and coded as .S. If no information was available from a prior interview because it was a proxy or Wave 2A, it will be coded as .P.

From Wave 9, a category with value 5 was added to represent "Does Not Apply".

## How Constructed

RwJSTRES indicates the extent to which the Respondent agrees with the statement that their job involves lots of stress.

RxJSTRES simply recodes missing values to SAS missing codes. If the question is skipped because the Respondent is not working, it is set to .W for not working. Unlike other job characteristic questions, this question is usually asked even if R is working at the same job. If skipped for some other reason, and R reported working at the prior interview, then the prior interview value is used.

Note that this question is not asked in any proxy interviews, but in many of these cases the prior interview report is used. Proxies for which this variable remains missing are set to .S.

If the value from a prior interview is used but is missing because the question wasn't asked or the interview was by proxy then current wave variable is set to .P, information from prior interview is missing.

In Wave 2A, there are only three levels of response as opposed to the four in other waves, and the wording reflects frequency rather than agreement. The omitted level in Wave 2A is the one that would correspond to "Strongly Agree" in other waves. The response of "Most of the time" is set to correspond to "Agree" in other waves, "Some of the time" is set to correspond to "Disagree", and "Hardly ever" is set to correspond to "Strongly Disagree."

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJSTRES.

## Cross Wave Differences in Original HRS Data

Each wave working Respondents are asked a number of questions about the job's characteristics. The question wording is the same across waves and asks:

"Here are some statements that are true for some people's jobs but not for others. Thinking of your job, please indicate how much you agree or disagree with each statement.

My job involves a lot of stress.

Do you strongly agree, agree, disagree or strongly disagree with that statement?"

In Wave 2A, the second part of the question was slightly different:

"Is this true most of the time, some of the time, or hardly ever?"

So for the AHEAD Respondents, R2JSTRES has one fewer response category (missing "All or almost all of the time"), and the wording reflects frequency not agreement.

In Wave 3A the question is asked separately and appears in different variables, depending on whether the Respondent is self-employed or not.

This question is asked if the Respondent is working, whether or not it is the same job as the prior interview.

From Wave 9, a category with value 5 was added to represent "Does Not Apply."

## How Constructed

RwJCTEN is the Respondent's years of tenure on the current job in Wave 'w.'

Current work status, reported job changes, current job start year and current interview date are used to derive the current job tenure for each interview. It is calculated in years, rounded to the nearest tenth, using current interview date minus current job start date. If the Respondent continues to hold the same job, the job start date is taken from the interview when the job was first reported, except when a self-employed Respondent gives a job start date that falls between interviews. In this case the given job start date is used.

Job start dates are reported as month and year or just year. If the month is missing or not asked, July is used as the month. If any reported job year is before the Respondent turned age 15, then it is set to the year the Respondent turned 15 instead.

If a Respondent reports a job start date that is before the prior interview, then the job start date is adjusted to be between the prior and current interviews. If the end date of a prior job is given, then it is set to the midpoint between the end of the prior job and the current interview. If the Respondent says they still have the ending job, then the start date is set to the previously given job start date. Otherwise it is set to the midpoint between the two interviews. This most frequently happens with the self-employed.

If the Respondent is not working, this variable is set to a .W missing code.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJCTEN.

## Cross Wave Differences in Original HRS Data

Each interview obtains the Respondent's current work status. At the Respondent's first interview questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date of the new one.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

## HRS Variables Used

HRS 1992:

V12717	F2:ANY WRK FOR PAY	:IND
V12718	F3:WHO WORK FOR	:IND
V2717	F2:ANY WRK FOR PAY	:IMP

## How Constructed

RwJCOCC is the Respondent's occupation on the current job in Wave "w" based on the 1980 Census codes. RwJCOCCA is also the Respondent's occupation on the current job, but with the codes used only for the AHEAD cohort in Waves 2A and 3A. RwJCOCCB is the Respondent's current job occupation based on the 2000 Census occupations used beginning in Wave 7. RwJCOCCC is the Respondent's current job occupation based on the 2010 Census occupations used beginning in Wave 10.

The current job occupation is usually taken from the interview when the job was first reported. It is carried forward if the Respondent continues working at the same job and position. If the Respondent is self-employed and reports a new occupation or the Respondent changes job title and reports a new occupation, then the current interview values are used.

The occupation codes differed between the AHEAD and other cohorts in Waves 2 and 3, and the AHEAD codes are not provided for other cohorts in any wave. For AHEAD Respondents both sets of codes are given in Wave 4 only. In each wave the unavailable set of codes is set to .Q for the appropriate variables, to indicate that the information is missing for this reason. Thus, in Waves 2A and 3A, RwJCOCC is set to .Q for the AHEAD cohort, and for Waves 2H, 3H, and 4 RwJCOCCA is set to .Q for other cohorts. From Wave 5 on the AHEAD codes are not provided for any cohort, so codes have been carried forward from an earlier wave.

From Wave 7 to Wave 10, HRS uses a different set of occupation codes, based on the 2000 Census. Before Wave 7 there are 17 possible occupation codes; from Wave 7-10, there are 25 codes. RwJCOCCB begins with R7JCOCCB and provides the new code set.

HRS provided the 1980 and 2000 Census codes for Wave 7 ONLY. R7JCOCC contains the 1980 Census codes and R7JCOCCB contains the 2000 Census codes. If the occupation question is not asked in Wave 7 because the Respondent has not changed jobs or job title, then R7JCOCCB is set to .P, for occupation taken from prior wave, and R7JCOCC provides the 1980 Census-based occupation. If R7JCOCCB is provided but the Respondent did not change jobs, they may have values for both R7JCOCC and R7JCOCCB. From Wave 8, if the Respondent starts a new job, then RwJCOCC is set to .B, to indicate that the occupation code is not from the 1980 Census codes.

Beginning in Wave 10, HRS uses another different set of occupation codes, based on the 2010 Census. Before Wave 10 there are 25 possible occupation codes; beginning in Wave 10, there are 23 codes. RwJCOCCC begins with R10JCOCCC and provides the new code set.

HRS provided the 2000 and 2010 Census codes for Wave 10 ONLY. R10JCOCCB contains the 2000 Census codes and R10JCOCCC contains the 2010 Census codes. If the occupation question is not asked in Wave 10 because the Respondent has not changed jobs or job title, then R10JCOCCC is set to .P, for occupation taken from prior wave, R10JCOCCB provides the 2000 Census-based occupation, and R10JCOCC provides the 1980 Census-based occupation. If R10JCOCCC is provided but the Respondent did not change jobs, they may have values for both R10JCOCCB and R10JCOCCC. From Wave 11, if the Respondent starts a new job, then RwJCOCC and RwJCOCCB are set to .B, to indicate that the occupation code is not from the 1980 and 2000 Census codes.

If the Respondent is not working, this variable is set to a .W missing code.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJCOCC, RwJCOCCA, RwJCOCCB and RwJCOCCC.

## Cross Wave Differences in Original HRS Data

Each interview obtains the Respondent's current work status. At the Respondent's first interview, questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date, occupation, and industry of the new one. If the Respondent reports a change in job title, then occupation and industry are asked, even if the employer is the same.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places

the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

Occupation codes for the AHEAD cohort (Waves 2A and 3A) differed from those collected from other cohorts. In Wave 4 only, both the AHEAD and HRS version of the codes are available for AHEAD Respondents, while only the HRS codes are available for other cohorts.

From Wave 1-8, the occupation codes are based on 1980 Census occupations, assigned to one of 17 categories. From Wave 7-10, they are based on 2000 Census occupations, assigned to one of 25 categories. Beginning in Wave 10, they are based on 2010 Census occupations, assigned to one of 23 categories. In Wave 7 only, we have both the 1980 and 2000 occupation codes stored in R7JCOCC and R7JCOCCB. In Wave 10 only, we have both the 2000 and 2010 occupation codes stored in R10JCOCCB and R10JCOCCC.

## How Constructed

RwJCIND is the industry of the Respondent's current job in Wave 'w.' RwJCINDB is the Respondent's current job industry based on the 2002 Census industries used beginning in Wave 8. RwJCINDC is the Respondent's current job industry based on the 2007 Census industries used beginning in Wave 10.

The current job industry is usually taken from the interview when the job was first reported. It is carried forward if the Respondent continues working at the same job and position. If the Respondent is self-employed and reports a new industry, then the current interview values are used.

In Waves 2A and 3A, industry information is NOT collected for any job. So for the AHEAD Respondents, R2JCIND and R3JCIND are set to the .Q SAS special missing value, to indicate that no information is available.

From Wave 7-10, HRS begins using a different set of industry codes, based on the 2002 Census. Before Wave 7 there are 13 possible industry codes; from Wave 7-10, there are 19 codes. RwJCINDB begins with R7JCINDB and provides the new code set. In Wave 7 only, we have both sets of codes stored in R7JCIND and R7JCINDB.

If this question is not asked in Wave 7 because the Respondent has not changed jobs or job title, then R7JCINDB is set to .P, for industry taken from prior wave and R7JCIND provides the 1980 Census-based industry. If R7JCINDB is provided but the Respondent did not change jobs, they may have values for both R7JCIND and R7JCINDB. If the Respondent started a new job in Wave 7, then R7JCIND is set to .B, to indicate that the industry code for the current job is taken from Wave 7 when the HRS begins to use the 2002 Census industries, which R7JCINDB provides.

Beginning in Wave 10, HRS begins using a different set of industry codes, based on the 2007 Census. The number of industry codes remains 19. RwJCINDC begins with R10JCINDC and provides the new code set. In Wave 10 only, we have both sets of codes stored in R10JCINDB and R10JCINDC.

If this question is not asked in Wave 10 because the Respondent has not changed jobs or job title, then R10JCINDC is set to .P, for industry taken from prior wave and R10JCINDB provides the 2002 Census-based industry. If R10JCINDC is provided but the Respondent did not change jobs, they may have values for both R10JCINDB and R10JCINDC. If the Respondent started a new job in Wave 10, then R10JCIND and R10JCINDB are set to .B, to indicate that the industry code for the current job is taken from Wave 10 when the HRS begins to use the 2007 Census industries, which R10JCINDC provides.

If the Respondent is not working, this variable is set to a .W missing code.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJCIND, RwJCINDB and RwJCINDC.

## Cross Wave Differences in Original HRS Data

Each interview obtains the Respondent's current work status. At the Respondent's first interview questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date, occupation, and industry of the new one. If the Respondent reports a change in job title, then occupation and industry are asked, even if the employer is the same. Note that in Waves 2A and 3A, industry information is NOT collected for any job.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

Before Wave 7, the industry codes are based on those used in the 1980 Census, assigned to one of 13 categories. From Wave 7-10, they are based on 2002 Census industries, assigned to one of 19 categories. Beginning in Wave 10, they are based on 2007 Census industries, assigned to one of 19 categories.

## How Constructed

RwUNION indicates whether the Respondent is covered by a union or employee-association contract, and RwUNIONF provides additional detail about the source of information for RwUNION. SwUNION and SwUNIONF provide the information for the Respondent's spouse or partner.

The question is the same in all waves: "Are you covered by a union or employee-association contract?" If the Respondent is not asked this question, is still working for the same employer, and has not changed job title, then their previous wave response is carried forward. These skip patterns do differ slightly across waves, so please read the Cross Wave Differences section below.

RwUNION is set to "1" if the Respondent reports being covered by a union. RwUNION is set to "0" if the Respondent is not covered by a union. RwUNION is set to .D for "Don't Know" and .R for "Refused" if the Respondent does not know or does not answer. It is set to .W if skipped because the Respondent has no current job, and set to .E if the question was skipped because the Respondent is self-employed. In the earlier waves, self-employed Respondents are asked this question, but in later waves they skip the union question. Again, please refer to the Cross Wave Differences section for a full explanation. If a value has been carried forward from a previous wave, then RwUNIONF is set to "1." If the value has been obtained from the current wave then RwUNIONF=0. If the Respondent reports being self-employed in the previous wave but is not self-employed in the current wave, we do not carry forward the special

missing value (.E). Instead, we set RwUNIONF=2 and RwUNION=.M:Missing.

SwUNION and SwUNIONF information is taken from the spouse's self-reported RwUNION and RwUNIONF variables, if available. If the Respondent is not married, SwUNION and SwUNIONF are set to .U=unmarried. If the Respondent's spouse did not respond, then SwUNION and SwUNIONF are set to .V=Spouse is non-response.

Because this question is not asked in Wave 2A, the variables are set to .Q.

### Cross Wave Differences in Original HRS Data

The question is the same in all waves, "Are you covered by a union or employee-association contract?" In Wave 1, the question is asked of all Respondents, whether or not they are self-employed.

In Wave 2H, we carry forward the Wave 1 response for anyone who did not respond in Wave 2H, but who had the same employer as Wave 1, and whose job title did not change.

This question was not asked in Wave 2A.

From Wave 3H onward, we carry forward the previous response, once it is established that the Respondent's employer has not changed and their job title has not changed. We do not carry forward the special missing value (.Q) for when the question was not asked in the survey.

From Wave 7 onward, Respondents that report being self-employed skip this question. But if the self-employed Respondents have answered the question in a previous wave, then we do carry the value forward. For those who are self-employed and have never been asked the question, we assign the special missing value of .E.

## How Constructed

RwFSIZE indicates how many people work in the Respondent's place of business, and RwFSIZEF provides additional detail about the source of information for RwFSIZE. SwFSIZE and SwFSIZEF provide the information for the Respondent's spouse or partner.

The question is the same in all waves: if the Respondent is self-employed the question is, "Including yourself, how many people work in this business?" If the Respondent works for someone else the question is, "About how many employees work for this company or organization at the location where you work?" Note that we have not used the additional question "About how many employees work for this company or organization at all locations?" to code this variable. If the Respondent is not asked this question and has not changed employer then their previous wave response is carried forward. RwFSIZE is set to .D for "Don't Know" and .R for "Refused" if the Respondent does not know or does not answer. It is set to .W if skipped because the Respondent has no current job.

If a value has been carried forward from a previous wave, then RwFSIZEF is set to "1." If the value has been obtained from the current wave then RwFSIZEF is set to "0." We do not carry forward missing values such as .D or .R. Instead, we set these cases to

RwFSIZE=.M for "Missing."

SwFSIZE and SwFSIZEF information is taken from the spouse's self-reported RwFSIZE and RwFSIZEF variables, if available. If the Respondent is not married, SwFSIZE and SwFSIZEF are set to .U for "Unmarried." If the Respondent's spouse did not respond, then SwFSIZE and SwFSIZEF are set to .V for "Spouse is non-response."

Because this question is not asked in Wave 2A, the variables are set to .Q.

## Cross Wave Differences in Original HRS Data

The question is the same in all waves: if the Respondent is self-employed the question is, "Including yourself, how many people work in this business?" If the Respondent works for someone else the question is, "About how many employees work for this company or organization at the location where you work?"

This question was not asked in Wave 2A.

From Wave 3H onward, we carry forward the previous response, once it is established that the Respondent's employer has not changed. We carry forward any value greater than 0. We do not carry forward any missing values.

In Wave 5 and 9 and from Wave 12 forward, Respondents working for the same employer as the previous wave do get asked the firm size question. For Wave 5 and 9, RwFSIZEF will be 0 as we do not need to carry any values forward. From Wave 12 forward, RwFSIZEF has low to no values of 1, as we very rarely need to carry any values forward.

In Wave 12 one respondent (HHIDPN=501112020) reports a firm size of 1,000,000. This respondent reports having the same employer since Wave 7 and in Wave 7, they reported a firm size of 1,000. In Wave 8, the respondent did not know the firm size so we carried forward the Wave 7 value. It is the responsibility of the researcher to decide how to handle this reported value.

Beginning in Wave 13, Respondents who work for the same business or employer as their previous interview will be asked this question every 3rd wave. From Wave 14, this results in more values being carried forward from previous waves.

## How Constructed

RwJLTEN is the Respondent's years of tenure on the longest-held job reported as of Wave 'w'. RwJLMIS counts the number of jobs that are examined in the derivation where the tenure cannot be determined because of missing dates.

SwJLTEN and SwJLMIS provide this information for the Respondent's spouse or partner.

The years of tenure at the longest reported job is derived using all reported jobs. Reported jobs include those at which a Respondent is working at any interview and those reported in the retrospective job history.

Except for the AHEAD entry cohort, a Respondent is asked about past jobs retrospectively at their first interview. If the Respondent is not working, information about the last job is collected. Whether working or not, questions are asked about up to three additional jobs lasting five or more years. These job history questions were not asked in Waves 2A or 3A. For those in the AHEAD entry cohort, job history information was collected at Wave 4.

Longest job tenure is determined by comparing the tenures derived from jobs given in the retrospective job history, current job tenures from current and previous interviews, and tenure on any job that ended between interviews up to the current, to determine the longest non-missing tenure. In Waves 2A and 3A, jobs reported in job history were collected in Wave 4, so their dates are compared to interview dates to determine whether or how long they lasted before the 2A or 3A interview.

In Wave 2A there is a question asked of some Respondents about the total years at the longest held job. If, after processing the current job and job history, R2JLTEN is less than the answer to this direct question, the direct question is used to set R2JLTEN, and the occupation associated with this job is used for R2JLOCCA. J2JLTENF is set to indicate if this replacement was done.

Since tenure at the longest-held job based on job history can not be modified using Wave 2A data, RwJLTENF is set to .Q for all Respondents who are not part of the AHEAD entry cohort to indicate that it is inapplicable for those cases.

RwJLMIS is a count of reported jobs that are missing dates; it does not count jobs for which dates are never asked. For example, if the Respondent reports having 7 jobs lasting 5 or more years in job history questions, no information will be asked about at least 4 of those jobs, because questions ask about at most 3 job start and stop dates. These 4 jobs will be missing job dates but are not counted in RwJLMIS. RwJLMIS counts only those jobs about which the Respondent is asked but failed to provide start or stop date information. Please see also 'Job History Status' later in this section.

Job start and stop dates are reported as month and year or just year. If the month is missing or not asked, July is used as the month. To help fill in job stop dates, the months and years given for retirement, disability, unemployment, and temporary layoff are also examined. These dates are asked when the Respondent reports the applicable employment status. If any reported job year is before the Respondent turned age 15, then it is set to the year the Respondent turned 15 instead.

The spouse variable is taken from the wave "w" spouse's self-report, e.g., S3JLTEN is taken from the Wave 3 spouse's R3JLTEN.

## Cross Wave Differences in Original HRS Data

Questions at each interview ask the Respondent's current work status and job change information. Generally at a Respondent's first interview, information about past jobs is obtained. The types of information, question wording, and general structure of questions on job transitions and history are similar across waves but some of the details vary. For the AHEAD entry cohort, the complete set of job history questions are not asked in Waves 2A and 3A, but are asked for the first time at Wave 4.

At the Respondent's first interview, or Wave 4 for the AHEAD entry cohort, questions are asked about past jobs. If the Respondent is not working, then information is gathered about their last job, if there is one. If the last job ended more than 20 years ago, the amount of information gathered is very limited. Otherwise, questions ask about the starting date, occupation, and industry of the last job. Whether the Respondent is working or not, questions also ask about jobs held 5 or more years, besides the current or last job. If the Respondent has at least one other past job held 5 or more years, the start and stop months, occupation, and industry are collected for the most recent one. If there is more than one 5-year job, then a question asks:

"Besides the jobs you have already told me about, have you worked for any other employer where you were included in a pension or retirement plan, or in a tax-deferred savings plan of some sort?"

If the Respondent answers yes, then the start and stop years of up to two of these jobs are obtained, but industry and occupation are not asked. Altogether the retrospective job history can provide information on up to 3 jobs and a last job, if the Respondent is unemployed. The 3 jobs will only include the most recent past job that lasted at least 5 years, and 2 more that offered pension or retirement plans.

In Wave 2A, if the Respondent is not working but has worked during the last two years, information about that last job is collected, including start and stop dates and occupation. Industry of the last job is not available. In addition, most people are asked if they ever worked for ten or more years. If so they are then asked if they worked for one employer for ten or more years, and if so, the occupation and number of years at the longest held job are collected. If not, another question asks the total years worked for pay.

Each interview obtains the Respondent's current work status. At the Respondent's first interview questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date, occupation, and industry of the new one. If the Respondent reports a change in job title, then occupation and industry are asked, even if the employer is the same. Note that in Waves 2A and 3A, industry information is NOT collected for any job.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

## How Constructed

The occupation code for the job with the longest reported tenure is assigned once the job with the longest tenure is identified. It can be the current job, a past job held since the first HRS interview, or a job reported in the job history data. The job history questions were not asked in Waves 2A or 3A. For those in the AHEAD entry cohort, job history information was collected at Wave 4.

The occupation of jobs held since the first interview is usually available.

RwJLOCC is set to the occupation code associated with the longest-held job reported. RwJLOCCA is set to the AHEAD code for occupation if the longest-held job reported occupation in Wave 2A, 3A, or 4. RwJLOCCB is set to a Census 2000-based occupation code if the longest-held job reported occupation in Wave 7-10. RwJLOCCC is set to a Census 2010-based occupation code if the longest-held job reported occupation from Wave 10. Occupation codes are simply recoded for missing values.

In Wave 2A there is a question asked of some Respondents about the total years at the longest held job. If, after processing the current job and job history, R2JLTEN is less than the answer to this direct question, the direct question is used to set R2JLTEN, and the occupation associated with this job is used for R2JLOCCA forward. RwJLTENF is set to indicate if this replacement was done.

Since tenure at the longest-held job based on job history can not be modified using Wave 2A data, RwJLTENF is set to .Q for all Respondents who are not part of the AHEAD entry cohort to indicate that it is inapplicable for those cases.

The occupation codes differed between the AHEAD and other cohorts in Waves 2 and 3, and the AHEAD codes are not provided for other cohorts in any wave. For AHEAD Respondents both sets of codes are given in Wave 4 only. In each wave the unavailable set of codes is set to .Q for the appropriate variables, to indicate that the information is missing for this reason. Thus, for Waves 2H, 3H, and 4 RwJLOCCA is set to .Q for other cohorts. For Wave 1 and from Wave 5 on the AHEAD codes have been carried back or forward from Waves 2A, 3A or 4.

Beginning in Wave 7, HRS begins using a different set of occupation codes, based on the 2000 Census. Before Wave 7 there are 17 possible occupation codes; from Wave 7-10, there are 25 codes; from Wave 10 forwards, there are 23 codes. RwJLOCCB begins with R7JLOCCB and RwJLOCCC begins with R10JLOCCC.

If the longest-held job is not a job for which occupation is reported in Wave 7, then R7JLOCCB is set to .P, for occupation taken from prior wave and R7JLOCC provides the 1980 Census-based occupation. If the longest tenured job provides an occupation code in Wave 7 and is one that continues from prior wave, the Respondent may have values for both R7JLOCC and R7JLOCCB. If the longest tenured job's occupation is only reported in Wave 7, then R7JLOCC is set to .B, to indicate that the occupation code for the longest tenured job is taken from Wave 7 when HRS begins to use the 2000 Census industries, which R7JLOCCB provides. This applies to waves 7-10.

If the longest-held job is not a job for which occupation is reported in Wave 10, then R10JLOCCC is set to .P, for occupation taken from prior wave. R10JLOCC provides the 1980 Census-based occupation and R10JLOCCB provides the 2000 Census-based occupation. If the longest tenured job provides an occupation code in Wave 10 and is one that continues from prior wave, the Respondent may have values for both R10JLOCC and R10JLOCCB and R10JCOCCC. If the longest tenured job's occupation is only reported in Wave 10, then R10JLOCC and R10JCOCCB are set to .B, to indicate that the occupation code for the longest tenured job is taken from Wave 10 when HRS begins to use the 2010 Census industries, which R10JLOCCC provides. This applies from Wave 10.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJLOCC, RwJLOCCA, RwJLOCCB, and RwJLOCCC.

## Cross Wave Differences in Original HRS Data

Questions at each interview ask the Respondent's current work status and job change information. Generally at a Respondent's first interview, information about past jobs is obtained. The types of information, question wording, and general structure of questions

on job transitions and history are similar across waves but some of the details vary. For the AHEAD entry cohort, the complete set of job history questions are not asked in Waves 2A and 3A, but are asked for the first time at Wave 4.

At the Respondent's first interview, or Wave 4 for the AHEAD entry cohort, questions are asked about past jobs. If the Respondent is not working, then information is gathered about their last job, if there is one. If the last job ended more than 20 years ago, the amount of information gathered is very limited. Otherwise, questions ask about the starting date, occupation, and industry of the last job. Whether the Respondent is working or not, questions also ask about jobs held 5 or more years, besides the current or last job. If the Respondent has at least one other past job held 5 or more years, the start and stop months, occupation, and industry are collected for the most recent one. If there is more than one 5-year job, then a question asks:

"Besides the jobs you have already told me about, have you worked for any other employer where you were included in a pension or retirement plan, or in a tax-deferred savings plan of some sort?"

If the Respondent answers yes, then the start and stop years of up to two of these jobs are obtained, but industry and occupation are not asked. Altogether the retrospective job history can provide information on up to 3 jobs and a last job, if the Respondent is unemployed. The 3 jobs will only include the most recent past job that lasted at least 5 years, and 2 more that offered pension or retirement plans.

In Wave 2A, if the Respondent is not working but has worked during the last two years, information about that last job is collected, including start and stop dates and occupation. Industry of the last job is not available. In addition, most people are asked if they ever worked for ten or more years. If so they are then asked if they worked for one employer for ten or more years, and if so, the occupation and number of years at the longest held job are collected. If not, another question asks the total years worked for pay.

Each interview obtains the Respondent's current work status. At the Respondent's first interview questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date, occupation, and industry of the new one. If the Respondent reports a change in job title, then occupation and industry are asked, even if the employer is the same.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

Occupation codes for the AHEAD cohort (Waves 2A and 3A) differed from those collected from other cohorts. In Wave 4 only, both the AHEAD and HRS version of the codes are available for AHEAD Respondents, while only the HRS codes are available for other cohorts.

Before Wave 7, the occupation codes are based on 1980 Census occupations, assigned to one of 17 categories. From Wave 7-10, they are based on 2000 Census occupations, assigned to one of 24 categories. Beginning in Wave 10, they are based on 2010 Census occupations, assigned to one of 23 categories.

## How Constructed

The industry code for the job with the longest reported tenure is assigned once the job with the longest tenure is identified. It can be the current job, a past job held since the first interview, or a job reported in the job history data. The job history questions were not asked in Waves 2A or 3A. For those in the AHEAD entry cohort, job history information was collected at Wave 4.

The industry of any job held in Waves 1, 2H, 3H and 4 is usually available. In Waves 2A and 3A, industry information is NOT

collected for any job.

RwJLIND is set to the industry code associated with the longest-held job reported. Industry codes are simply recoded for missing values.

From Wave 7-10, HRS uses a different set of industry codes, based on the 2002 Census. And from Wave 10 forward, HRS uses a set of industry codes based on the 2007 Census. Before Wave 7 there are 13 possible industry codes; from Wave 7 forward, there are 19 codes. RwJLINDB begins with R7JLINDB and provides the 2002 code set. RwJLINDC begins with R10JLINDC and provides the 2007 code set.

If the longest tenured job is not a job for which industry is reported in Wave 7, then R7JLINDB is set to .P, for industry taken from prior wave and R7JLIND provides the 1980 Census-based industry. If the longest tenured job provides an industry code in Wave 7 and is one that continues from prior wave, the Respondent may have values for both R7JLIND and R7JLINDB. If the longest tenured job's industry is only reported in Wave 7, then R7JLIND is set to .B, to indicate that the industry code for the longest tenured job is taken from Wave 7 when HRS begins to use the 2002 Census industries, which R7JLINDB provides.

If the longest tenured job is not a job for which industry is reported in Wave 10, then R10JLINDC is set to .P, for industry taken from prior wave and R10JLIND provides the 1980 Census-based industry or R10JLINDB provides the 2002 Census-based industry code. If the longest tenured job provides an industry code in Wave 10 and is one that continues from prior wave, the Respondent may have values for R10JLIND, R10JLINDB and R10JLINDC. If the longest tenured job's industry is only reported in Wave 10, then R10JLIND and R10JLINDB are set to .B, to indicate that the industry code for the longest tenured job is taken from Wave 10 when HRS begins to use the 2007 Census industries, which R10JLINDC provides.

The spouse variable is taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJLIND , RwJLINDB and RwJLINDC.

### **Cross Wave Differences in Original HRS Data**

Questions at each interview ask the Respondent's current work status and job change information. Generally at a Respondent's first interview, information about past jobs is obtained. The types of information, question wording, and general structure of questions on job transitions and history are similar across waves but some of the details vary. For the AHEAD entry cohort, the complete set of job history questions are not asked in Waves 2A and 3A, but are asked for the first time at Wave 4.

At the Respondent's first interview, or Wave 4 for the AHEAD entry cohort, questions are asked about past jobs. If the Respondent is not working, then information is gathered about their last job, if there is one. If the last job ended more than 20 years ago, the amount of information gathered is very limited. Otherwise, questions ask about the starting date, occupation, and industry of the last job. Whether the Respondent is working or not, questions also ask about jobs held 5 or more years, besides the current or last job. If the Respondent has at least one other past job held 5 or more years, the start and stop months, occupation, and industry are collected for the most recent one. If there is more than one 5-year job, then a question asks:

Besides the jobs you have already told me about, have you worked for any other employer where you were included in a pension or retirement plan, or in a tax-deferred savings plan of some sort?

If the Respondent answers yes, then the start and stop years of up to two of these jobs are obtained, but industry and occupation are not asked. Altogether the retrospective job history can provide information on up to 3 jobs and a last job, if the Respondent is unemployed. The 3 jobs will only include the most recent past job that lasted at least 5 years, and 2 more that offered pension or retirement plans.

In Wave 2A, if the Respondent is not working but has worked during the last two years, information about that last job is collected, including start and stop dates and occupation. Industry of the last job is not available. In addition, most people are asked if they ever worked for ten or more years. If so they are then asked if they worked for one employer for ten or more years, and if so, the occupation and number of years at the longest held job are collected. If not, another question asks the total years worked for pay.

Each interview obtains the Respondent's current work status. At the Respondent's first interview questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment

status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date, occupation, and industry of the new one. If the Respondent reports a change in job title, then occupation and industry are asked, even if the employer is the same. Note that in Waves 2A and 3A, industry information is NOT collected for any job.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

Before Wave 7, the industry codes are based on those used in the 1980 Census, assigned to one of 13 categories. From Wave 7-10, they are based on 2002 Census industries, assigned to one of 19 categories. From Wave 10 forward, they are based on 2007 Census industries, also assigned to one of 19 categories.

## How Constructed

RwJJOBS gives the status of the Respondent's job history including jobs reported as current at interviews. RwJNJOBS is the number of jobs the Respondent reports having through job history and job transition questions at each interview. RwJMISS is the number of these jobs that are missing dates, including jobs about which no questions are ever asked. RwJNJOB5 is the number of jobs the Respondent reports holding for 5 or more years, including those reported in job history, and through job transition questions.

SwJJOBS, SwJNJOBS, SwJMISS, and SwJNJOB5 are the same information for the Respondent's spouse or partner.

RwJJOBS is a categorical variable which is set to "0" if the Respondent never reports working; "1" if the Respondent has worked but has a tenure of less than 5 years on all jobs; "2" if the Respondent has had at least one job lasting 5 or more years; "8" if the Respondent has worked but there is not enough information to determine whether any job lasted 5 or more years; and "9" when whether the Respondent ever worked is missing. It is based on examination of reports on numbers of jobs in job history and the lengths of those jobs, together with the jobs reported at each interview.

RwJNJOBS includes the job last worked, if the Respondent is unemployed at their first interview, the number of jobs lasting 5 or more years as reported in job history, and the current count of jobs observed at each interview. RwJMISS includes any jobs where the reported dates are missing. It also includes jobs for which no dates are asked. For example, if the Respondent reports having 7 jobs lasting 5 or more years in job history, the questions will ask for dates on at most 3 of these jobs, so RwJMISS would be at least 4.

RwJNJOB5 counts only those jobs that are determined to last 5 or more years. The length of a job is determined by examining start and stop dates, if available. If a Respondent reports having multiple 5-year jobs in job history, those for which dates are missing or not ascertained are counted. In some cases, an individual may report having a 5-year job, but when asked for the start and stop dates for the job, provides dates that are short of the 5-year period. Such jobs are NOT counted in RwJNJOB5.

The spouse variables are taken from the Wave "w" spouse's self-report, e.g., S3JJOBS is taken from the Wave 3 spouse's RwJJOBS.

## Cross Wave Differences in Original HRS Data

Questions at each interview ask the Respondent's current work status and job change information. Generally at a Respondent's first interview, information about past jobs is obtained. The types of information, question wording, and general structure of questions on job transitions and history are similar across waves but some of the details vary. For the AHEAD entry cohort, the complete set of job history questions are not asked in Waves 2A and 3A, but are asked for the first time at Wave 4.

At the Respondent's first interview, or Wave 4 for the AHEAD entry cohort, questions are asked about past jobs. If the Respondent is not working, then information is gathered about their last job, if there is one. If the last job ended more than 20 years ago, the amount of information gathered is very limited. Otherwise, questions ask about the starting date, occupation, and industry of the last job. Whether the Respondent is working or not, questions also ask about jobs held 5 or more years, besides the current or last job. If the Respondent has at least one other past job held 5 or more years, the start and stop months, occupation, and industry are collected for the most recent one. If there is more than one 5-year job, then a question asks:

"Besides the jobs you have already told me about, have you worked for any other employer where you were included in a pension or retirement plan, or in a tax-deferred savings plan of some sort?"

If the Respondent answers yes, then the start and stop years of up to two of these jobs are obtained, but industry and occupation are not asked. Altogether the retrospective job history can provide information on up to 3 jobs and a last job, if the Respondent is unemployed. The 3 jobs will only include the most recent past job that lasted at least 5 years, and 2 more that offered pension or retirement plans.

In Wave 2A, if the Respondent is not working but has worked during the last two years, information about that last job is collected, including start and stop dates and occupation. Industry of the last job is not available. In addition, most people are asked if they ever worked for ten or more years. If so, they are then asked if they worked for one employer for ten or more years, and if so, the occupation and number of years at the longest held job are collected. If not, another question asks the total years worked for pay.

Each interview obtains the Respondent's current work status. At the Respondent's first interview, questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date, occupation, and industry of the new one. If the Respondent reports a change in job title, then occupation and industry are asked, even if the employer is the same. Note that in Waves 2A and 3A, industry information is NOT collected for any job.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

## How Constructed

RwJYEARS is the total number of self-reported years worked. RwJYEARM indicates how many missing values are encountered in the derivation of RwJYEARS.

RwJYEARS is derived using all reported jobs and variables regarding number of years worked which was obtained in Wave 3H and from Wave 4 forward. Reported jobs include those at which a Respondent is working at any interview and those reported in the retrospective job history.

Except for the AHEAD entry cohort, a Respondent is asked about past jobs retrospectively at their first interview. If the Respondent is not working, information about the last job is collected. Whether working or not, questions are asked about up to three additional jobs lasting five or more years. These job history questions were not asked in Waves 2A or 3A. For those in the AHEAD entry cohort, job history information was collected at Wave 4.

In Wave 3H and from Wave 4 forward, the Respondent is asked for the earliest year and total number of years worked before the earliest job previously reported in job history.

The derivation uses the earliest year worked and number of years worked variables, along with retrospective job history and all jobs reported since the first interview. In Waves 2A and 3A, jobs reported in the retrospective job history were collected in Wave 4, so their dates are compared to interview dates to determine whether or how long they lasted before the 2A or 3A interview.

The retrospective job history and jobs reported at interviews are compared for overlapping dates so as not to double count years of work. If both job start or stop years are missing, the years of work in those jobs are not added. If one of the years is missing and the job is reported among those lasting 5+ years, the missing year is assumed to be 5 years away from the non-missing year. If one of the years is missing, and the job is reported as the most recent job by an unemployed Respondent (as part of the job history information), then that job is counted as lasting one year. Thus RwJYEARS represents the minimum number of years worked that could be determined.

In Wave 2A some Respondents are asked about the total years worked, and others about total years at the longest held job. If, after processing the current job and job history, R2JYEARS is less than the answer to either of these direct questions, the direct question is used to set R2JYEAR, and RwJYEARS in subsequent waves is adjusted appropriately.

RwJYEARM is a flag that indicates if any of the reported job dates are missing, or if the earliest year worked (or number of years worked up to preloaded first reported year worked) is either not available or missing. It also indicates if the Wave 2A direct question was used. Years worked counts any part of a year as a whole year.

Spouse variables are taken from the Respondent's spouse's self-reported variables, i.e., they are taken the spouse's RwJYEARS and RwJYEARM.

## Cross Wave Differences in Original HRS Data

Questions at each interview ask the Respondent's current work status and job change information. Generally at a Respondent's first interview, information about past jobs is obtained. The types of information, question wording, and general structure of questions on job transitions and history are similar across waves but some of the details vary. For the AHEAD entry cohort, the complete set of job history questions are not asked in Waves 2A and 3A, but are asked for the first time at Wave 4. In Wave 3H and from Wave 4 forward, new questions ask about the Respondent's years worked before the first job reported in prior waves.

At the Respondent's first interview, or Wave 4 for the AHEAD entry cohort, questions are asked about past jobs. If the Respondent is not working, then information is gathered about their last job, if there is one. If the last job ended more than 20 years ago, the amount of information gathered is very limited. Otherwise, questions ask about the starting date, occupation, and industry of the last job. Whether the Respondent is working or not, questions also ask about jobs held 5 or more years, besides the current or last job. If the Respondent has at least one other past job held 5 or more years, the start and stop months, occupation, and industry are collected for the most recent one. If there is more than one 5-year job, then a question asks:

"Besides the jobs you have already told me about, have you worked for any other employer where you were included in a pension or retirement plan, or in a tax-deferred savings plan of some sort?"

If the Respondent answers yes, then the start and stop years of up to two of these jobs are obtained, but industry and occupation are not asked. Altogether the retrospective job history can provide information on up to 3 jobs and a last job, if the Respondent is unemployed. The 3 jobs will only include the most recent past job that lasted at least 5 years, and 2 more that offered pension or retirement plans.

In Wave 2A, if the Respondent is not working but has worked during the last two years, information about that last job is collected, including start and stop dates and occupation. Industry of the last job is not available. In addition, most people are asked if they ever worked for ten or more years. If so they are then asked if they worked for one employer for ten or more years, and if so, the occupation and number of years at the longest held job are collected. If not, another question asks the total years worked for pay.

In Wave 3H, or at the first interview from Wave 4 forward to which the Respondent responds, a question is added that asks when the Respondent first worked for 6 months or more. Follow-up questions ask how many years the Respondent worked 6 months or more between the year first worked and a preloaded value. The preloaded value is the earliest start year of all jobs reported, presumably derived from job history given at the first interview.

Each interview obtains the Respondent's current work status. At the Respondent's first interview, questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews, and the start date, occupation, and industry of the new one. If the Respondent reports a change in job title, then occupation and industry are asked, even if the employer is the same.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

## How Constructed

RwJLASTM and RwJLASTY are the month and year, respectively, when the Respondent last worked. It is set to missing value .W if the Respondent is working at Wave 'w.'

Except for the AHEAD entry cohort, a Respondent is asked about past jobs retrospectively at their first interview. If the Respondent is not working, information about the last job is collected. If the Respondent reports ever having worked, then the start and stop years of the most recent job held are obtained. Regardless of whether the Respondent is working or not, questions ask about jobs held for 5 or more years. If the Respondent worked for 5+ years on any other jobs, start and stop dates are obtained for the most recent of them. If any other of the 5+ year jobs had a retirement plan, up to 2 more job start and stop years may be asked. These job history questions were not asked in Waves 2A or 3A. For those in the AHEAD entry cohort, job history information was collected at Wave 4. In Wave 2A if the Respondent is unemployed but has worked in the last two years, then the stop date of the last job is asked.

After the first interview, the Respondent is asked when the last interview job ended if the Respondent changes work status, e.g., from employed to not.

For the first interview, the most recent job stop date is selected from among the retrospective job history dates that precede the interview, if the Respondent is not working. This is based on a comparison of the actual dates given rather than simply using the particular "most recent job" question.

At subsequent interviews where the Respondent is not working, they are asked when the previous interview job ended. The derivation uses the most recent job stop date. This is based on a comparison of the actual dates given, selecting the most recent date. If the Respondent is not working over consecutive waves, RwJLASTM and RwJLASTY are carried forward.

Job stop dates are reported as month and year or just year. If the month is missing then RwJLASTM is set to missing. To help fill in missing job stop dates between interviews, the months and years given for retirement, disability, unemployment, and temporary layoff are also examined. These dates are asked when the Respondent reports the applicable employment status.

If the Respondent is working, then RwJLASTM and RwJLASTY are set to a .W missing code. If the Respondent never worked, RwJLASTM and RwJLASTY are set to a .N missing code.

SwJLASTM and SwJLASTY are taken from the wave "w" spouse's self-report, i.e., from the spouse's RwJLASTM and RwJLASTY.

## Cross Wave Differences in Original HRS Data

Questions at each interview ask the Respondent's current work status and job change information. Generally at a Respondent's first interview, information about past jobs is obtained. The types of information, question wording, and general structure of questions on job transitions and history are similar across waves but some of the details vary. For the AHEAD entry cohort, the complete set of job history questions are not asked in Waves 2A and 3A, but are asked for the first time at Wave 4.

At the Respondent's first interview, or Wave 4 for the AHEAD entry cohort, questions are asked about past jobs. If the Respondent is not working, then information is gathered about their last job, if there is one. Whether the Respondent is working or not, questions also ask about jobs held 5 or more years, besides the current or last job. If the Respondent has at least one other past job held 5 or more

years, the start and stop months, occupation, and industry are collected for the most recent one. If there is more than one 5-year job, then a question asks:

"Besides the jobs you have already told me about, have you worked for any other employer where you were included in a pension or retirement plan, or in a tax-deferred savings plan of some sort?"

If the Respondent answers yes, then the start and stop years of up to two of these jobs are obtained, but industry and occupation are not asked. Altogether the retrospective job history can provide information on up to 3 jobs and a last job, if the Respondent is unemployed. The 3 jobs will only include the most recent past job that lasted at least 5 years, and 2 more that offered pension or retirement plans.

In Wave 2A, if the Respondent is not working, but has worked during the last two years, information about that last job is collected, including the stop date.

Each interview obtains the Respondent's current work status. At the Respondent's first interview, questions ask the start date, industry, and occupation of their current job if they are working. At subsequent interviews, changes in work status, self-employment status, or employer trigger questions that ask for the stop date of the job that ended between interviews.

There are many differences across waves in the way the interview proceeds through these job questions, e.g., how many places the same question is asked, which questions are skipped, how much the skip pattern depends on preloaded information, etc.

## General Comments

RwLBWGTR, RwLBELIG, and RwLBCOMP and their corresponding spouse variables are indicators used to identify Respondents to the Leave-Behind Questionnaire in a given wave. The survey is also referred to as the "Psychosocial and Lifestyle Questionnaire," the "Questionnaire on Your Everyday Life and Well-being," the "Participant Lifestyle Questionnaire," or the "Self-Administered Questionnaire (SAQ)." More detailed information about the administration of the Leave-Behind Questionnaire can be found in the [2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) on the HRS website.

## How Constructed

The sampling weight RwLBWGTR is taken directly from the Tracker variables xLBWGTR, described in the Tracker file documentation and in the [2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) under Section "Weights." It is the product of (1) the core nursing home weights for the given wave, (2) a non-response adjustment factor, and (3) a post stratification adjustment to the weighted HRS sample. To adjust for non-response, HRS utilized a propensity model for completing the psychosocial SAQ among all eligible cases. Predictor variables include age, sex, race/ethnicity, coupleness, education, work status, self-rated health, counts of functional limitations (Nagi, IADL and ADL), vision rating, cognitive status, and religious attendance. Weights are provided at the Respondent level.

RwLBELIG indicates whether a Respondent was eligible to receive the Leave-Behind Survey. Half of the HRS sample is eligible to receive the survey in each wave. The alternative half of the sample is eligible to receive the survey in the following wave. This results in an alternating wave pattern for each Respondent, where Respondents will be eligible in non-consecutive waves or every four years. Respondents who are eligible to take the Leave-Behind Survey are coded as 1 while Respondents assigned to the other cohort are coded as 0.

RwLBCOMP indicates whether an eligible Respondent returned the Leave-Behind Survey. Respondents who returned the Leave-Behind Survey in a given wave are coded as 1 while eligible Respondents who fail to return the questionnaire are coded as 0. Those who are ineligible are set to ".A" Ineligible for Leave-Behind.

SwLBWGTR, SwLBELIG and SwLBCOMP are analogous variables for spouses. Beginning in Wave 9 (2008), a Respondent's eligibility matches that of their spouse or partner except in specific cases where two Respondents already part of the HRS study with existing mismatched eligibility become spouses.

## Cross Wave Differences in Original HRS Data

In Wave 8 (2006), the Leave-Behind Survey was administered to Respondents who completed their HRS core interview in person as opposed to by telephone. Respondents whose interview was completed by a proxy Respondent and those residing in nursing homes were eligible as long as the interview was conducted in person. In Waves 9-12 (2008-2014) the mode restriction was lifted and all living Respondents were eligible for the Leave-Behind Questionnaire. Beginning in Wave 13 (2016), the eligibility rules were tightened to match those for the HRS Physical Measures and Biomarkers. Specifically, the Leave-Behind Questionnaire will only be administered to self-Respondents who are non-institutionalized and who complete their HRS core interview through the first section of the core interview in person.

In Wave 8 and Wave 9 (2006 and 2008), Respondents who had not returned a Leave-Behind Questionnaire after the second reminder notice were offered the option of completing the Leave-Behind Questionnaire by telephone. This practice was discontinued after Wave 9 due to cost.

Beginning in Wave 8 (2006), Respondents received a \$20 incentive for the Leave-Behind Questionnaire. For most Respondents, this incentive is presented at the end of the interview when the interviewer introduces the Leave-Behind Questionnaire. However, in Wave 10 the Leave-Behind incentive was including with other interview incentives. New cohort Respondents typically received their interview incentive at the end of the interview, after the Leave-Behind questionnaire was introduced. They were not informed that part of the incentive was for the core interview and part for the Leave-Behind Questionnaire.

In Wave 8 (2006), 172 spouse pairs have mismatched eligibility. This mismatch is due to a mode switch that occurred for one Respondent in the spouse pair. Beginning in Wave 9, this mode switch no longer categorized Respondents as ineligible. Respondents who were ineligible for this reason in Wave 8 retain their original eligibility pattern and have synchronized eligibility with their spouse thereafter.

## HRS Variables Used

HRS 2006-2020:

## General Comments

Construction of the scales, based on information elicited in the Leave-Behind Survey, follows the instructions in [HRS 2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) unless otherwise noted. If more than half of HRS Leave-Behind components in a scale are missing, the scale is set to ".P" missing due to partial scale inputs. If a Respondent did not return the questionnaire, the scale is set to ".N" to indicate not returned.

## How Constructed

RwLBNEUR, RwLBEXT, RwLBOPEN, RwLBAGR, RwLBCON5, and RwLBCON10 are scale indicators used to assess the Respondent's "Big 5" personality traits: Neuroticism, Extraversion, Openness to Experience, Agreeableness, and Conscientiousness. These scales are based on responses to questions drawn from the survey of Midlife Development in the U.S. (MIDUS) and the International Personality Item Pool (IPIP). Responses indicate how much an item describes a Respondent using one of four scored categories, "1=A lot," "2=Some," "3=A little," or "4=Not at All." Items are scored 1-4 by HRS. Note in some cases higher scores on input questions correspond to less of a personality trait. Before averaging response scores, inputs are harmonized so that responses with higher values always correspond to more of a personality trait.

RwLBNEUR averages "Calm" with the inversion of "Moody," "Worrying," and "Nervous." Thus, the higher the score, the higher the Respondent rates in Neuroticism based on the sub-dimensions asked as part of the Leave-Behind Survey. If more than two items are missing the scale is also set to missing.

RwLBEXT averages the inversion of "Outgoing," "Friendly," "Lively," "Active," and "Talkative." Thus, the higher the score, the higher the Respondent rates in Extroversion based on the sub-dimensions asked as part of the Leave-Behind Survey. If more than two items are missing the scale is also set to missing.

RwLBOPEN averages the inversion of "Creative," "Imaginative," "Intelligent," "Curious," "Broad-minded," "Sophisticated," and "Adventurous." Thus, the higher the score, the higher the Respondent rates in Openness to Experience based on the sub-dimensions asked as part of the Leave-Behind Survey. If more than two items are missing the scale is also set to missing.

RwLBAGR averages the inversion of "Helpful," "Warm," "Caring," "Softhearted," and "Sympathetic." Thus, the higher the score, the higher the Respondent rates in Agreeableness based on the sub-dimensions asked as part of the Leave-Behind Survey. If more than two items are missing the scale is also set to missing.

RwLBCON5 averages "Careless" with the inversion of "Organized," "Responsible," "Hardworking," and "Thorough." Thus, the higher the score, the higher the Respondent rates in Conscientiousness based on the sub-dimensions asked as part of the Leave-Behind Survey. If more than two items are missing the scale is also set to missing.

RwLBCON10 averages "Careless," "Reckless," and "Impulsive" with the inversion of "Organized," "Responsible," "Hardworking," "Self-disciplined," "Cautious," "Thorough," and "Thrifty." Thus, the higher the score, the higher the Respondent rates in Conscientiousness based on the sub-dimensions asked as part of the Leave-Behind Survey. The ten-item version of this scale begins in Wave 10 (2010) when these additional items were added to the Leave-Behind Questionnaire. If more than five items are missing the scale is also set to missing.

SwLBNEUR, SwLBEXT, SwLBOPEN, SwLBAGR, SwLBCON5, and SwLBCON10 are analogous spouse variables.

### Cross Wave Differences in Original HRS Data

The "Big 5" personality scales are provided starting in Wave 8 (2006). While some "Big 5" inputs were asked in Wave 7 (2004), the pilot administration of the survey, responses differ significantly during this wave, so we do not produce measures for Wave 7.

In Wave 10 (2010), the HRS added five items drawn from the International Personality Item Pool (IPIP) to expand coverage of sub-facets of conscientiousness. Thus RwCON10 is produced to capture these additional items from this wave on. The original five items continue to be asked after Wave 10 and are provided in measure RwCON5.

Beginning in Wave 10 (2010), the addition of new items changes the question order of the "Big 5" section of the Leave-Behind Survey.

By design the Leave-Behind Survey is administered to select Respondents once every four years or every other wave. As a result, Respondents are only eligible to complete the survey in alternating waves. Respondents who did not respond because they are ineligible to participate in a wave are marked ".A" to indicate they are assigned to the alternative cohort.

## General Comments

Construction of the scales, based on information elicited in the Leave-Behind Survey, follows the instructions in [HRS 2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) unless otherwise noted. If more than half of HRS Leave-Behind components in a scale are missing, the scale is to ".P" missing due to partial scale inputs. If a Respondent did not return the questionnaire, the scale is set to ".N" to indicate not returned.

## How Constructed

RwLBLONELY3 and RwLBLONELY11 are scale indicators used to assess the Respondent's feelings of loneliness. These scales are based on responses to questions drawn from the Revised UCLA Loneliness Scale. Responses indicate how much of the time an item is felt using one of three categories, "1=Often," "2=Some of the time," or "3=Hardly ever or never." Items are scored 1-3 by HRS. Note in some cases higher scores on input questions correspond to less loneliness. Before averaging response scores, inputs are harmonized so that responses with higher values always correspond to more loneliness.

RwLBLONELY3 averages the inversion of the questions "You lack companionship," "Left out," and "Isolated from others." Thus, the higher the score, the higher the Respondent rates in Loneliness based on the sub-dimensions asked as part of the Leave-Behind Survey. If more than one item is missing the scale is also set to missing.

RwLBLONELY11 averages the questions "That you are in "in tune" with the people around you," "That there are people you can talk to," "That there are people you can turn to," "That there are people who really understand you," "That there are people you feel close to," "Part of a group of friends," and "That you have a lot in common with the people around you" with the inversion of the questions "You lack companionship," "Left out," "Isolated from others," and "Alone." Thus, the higher the score, the higher the Respondent rates in Loneliness based on the sub-dimensions asked as part of the Leave-Behind Survey. If more than five items are missing the scale is also set to missing.

SwLBLONELY3 and SwLBLONELY11 are analogous spouse variables.

## Cross Wave Differences in Original HRS Data

Loneliness scales are provided starting in Wave 8 (2006). While some Loneliness inputs were asked in Wave 7, the pilot administration of the survey, responses differ significantly during this wave, so we do not produce measures for Wave 7. Interested users may reconstruct the 3-question Loneliness Scale for Wave 7 (2004) from HRS data.

In Wave 9 (2008), the HRS added 8 items to enhance reliability and expand the sub-dimensions of loneliness being captured. Thus, beginning in Wave 9, RwLBLONELY11 is produced to capture these additional items. The original three items continue to be

asked after Wave 9 in the same question order and are provided in measure RwLBLONELY3.

By design the Leave-Behind Survey is administered to select Respondents once every four years or every other wave. As a result, Respondents are only eligible to complete the survey in alternating waves. Respondents who did not respond because they are ineligible to participate in a wave are marked ".A" to indicate they are assigned to the alternative cohort.

## General Comments

Construction of the scale, based on information elicited in the Leave-Behind Survey, follows the instructions in the [HRS 2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) and relevant literature. Harmonization and processing occurs for all Leave-Behind measures. If a Respondent did not return the questionnaire, scales and measures are set to ".N" to indicate not returned.

## How Constructed

RwLBHLTHPRB, RwLBFAMHLTHPRB, RwLBFAMDRUGPRB, RwLBWORKPRB, RwLBFINPRB, RwLBHOUSEPRB, RwLBRLTNSHPRB, and RwLBASSISTPRB are questions used to assess a Respondent's exposure and perception of common chronic stressors. Responses indicate if a problem has lasted at least twelve months and how upsetting each problem has been using one of four categories, "1=No, didn't happen," "2=Yes, but not upsetting," "3=Yes, somewhat upsetting," or "4=Yes, very upsetting." Items are scored 1-4 by HRS.

RwLBONCHRSTR is a scale indicator that assesses the Respondent's cumulative chronic stress. It identifies instances of chronic stress using the categorization method found in "Chronic stress burden, discrimination, and subclinical carotid artery disease in African American and Caucasian women." (Troxel et al., 2003) that identifies the response "Yes, very upsetting" as indicating chronic stress. The scale counts each instance of a "Yes, very upsetting" response for the eight input questions. This method uses the scale construction suggested in [2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) "Ongoing Chronic Stressors" in combination with Troxel's method for identifying chronic stress responses.

RwLBHLTHPRB, RwLBFAMHLTHPRB, RwLBFAMDRUGPRB, RwLBWORKPRB, RwLBFINPRB, RwLBHOUSEPRB, RwLBRLTNSHPRB, and RwLBASSISTPRB provide reports of ongoing stressful problems and perception of associated stress. RwLBHLTHPRB identifies if a Respondent reports "Ongoing health problems (in yourself)." RwLBFAMHLTHPRB identifies if a Respondent reports "Ongoing physical or emotional problems (in spouse or child)." RwLBFAMDRUGPRB identifies if a Respondent reports "Ongoing problems with alcohol or drug use in family member." RwLBWORKPRB identifies if a Respondent reports "Ongoing difficulties at work." RwLBFINPRB identifies if a Respondent reports "Ongoing financial strain." RwLBHOUSEPRB identifies if a

Respondent reports "Ongoing housing problems." RwlBRLTNSHPRB identifies if a Respondent reports "Ongoing problems in a close relationship." RwlBASSISTPRB identifies if a Respondent reports "Helping at least one sick, limited, or frail family member or friend on a regular basis."

RwlBONCHRSTR counts all responses of "Yes, very upsetting" to the eight chronic stress input questions. The scale dichotomously treats lower levels of perceived stress, nonoccurrence of problems, or non-response as a zero value. Thus, the higher the score, the higher the Respondent rates in ongoing chronic stress.

SwLBHLTHPRB, SwLBFAMHLTHPRB, SwLBFAMDRUGPRB, SwLBWORKPRB, SwLBFINPRB, SwLBHOUSEPRB, SwLBRLTNSHPRB, SwLBASSISTPRB, and SwLBONCHRSTR are analogous spouse variables.

## Cross Wave Differences in Original HRS Data

The Ongoing Chronic Stressor Scale and its input questions are provided starting in Wave 8 (2006). In Wave 9 (2008) HRS did not ask Leave-Behind Respondents the input questions for the scale, so they are not provided for this wave.

By design the Leave-Behind Survey is administered to select Respondents once every four years or every other wave. As a result, Respondents are only eligible to complete the survey in alternating waves. Respondents who did not respond because they are ineligible to participate in a wave are marked ".A" to indicate they are assigned to the alternative cohort.

## HRS Variables Used

### HRS 2006:

KLB040A	Q40A. ONGOING HEALTH PROBLEM - YOURSELF

## General Comments

Construction of the scales, based on information elicited in the Leave-Behind Survey, follows the instructions in [HRS 2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) unless otherwise noted. If more than half of HRS Leave-Behind components in a scale are missing, the scale is to ".P" missing due to partial scale inputs. If a Respondent did not return the questionnaire, the scale is set to ".N" to indicate not returned.

## How Constructed

R8LBPOSAFFECT6, R8LBNEGAFFECT6, R8LBPOSAFFECT, and R8LBNEGAFFECT are scale indicators used to assess the positive and negative dimensions of emotional well-being. R8LBPOSAFFECT6 and R8LBNEGAFFECT6 scales are based on items drawn from the survey of Midlife Development in the U.S. (MIDUS). Responses indicate how frequently an item is felt using one of five categories, "1=All of the time," "2=Most of the time," "3=Some of the time," "4=A little of the time," or "5=None of the time." Items are scored 1-5 by HRS. Note higher scores on input questions correspond to less affect. Before averaging response scores, inputs are therefore inverted so that responses with higher values correspond to more affect.

RwLBPOSAFFECT and RwLBNEGAFFECT scales are based on items drawn from Positive and Negative Affect Schedule – Expanded Form (PANAS-X; Watson & Clark, 1994). Responses indicate how much an item is felt using one of five categories, "1=Very much," "2=Quite a bit," "3=Moderately," "4=A little," or "5=Not at all." Items are scored 1-5 by HRS. Note higher scores on input questions correspond to less affect. Before averaging response scores, inputs are therefore inverted so that responses with higher values correspond to more affect.

R8LBPOSAFFECT6 averages the inversion of "cheerful," "in good spirits," "extremely happy," "calm and peaceful," "satisfied," and "full of life." Thus, the higher the score, the higher the Respondent rates in the positive affect dimension of emotional well-being based on the sub-components asked as part of the Leave-Behind Survey. If more than three items are missing the scale is also set to missing.

R8LBNEGAFFECT6 averages the inversion of "so depressed that nothing could cheer you up," "hopeless," "restless or fidgety," "that everything was an effort," "worthless," and "nervous." Thus, the higher the score, the higher the Respondent rates in the negative affect dimension of emotional well-being based on the sub-components asked as part of the Leave-Behind Survey. If more than three items are missing the scale is also set to missing.

RwLBPOSAFFECT averages the inversion of "Determined," "Enthusiastic," "Active," "Proud," "Interested," "Happy," "Attentive," "Content," "Inspired," "Hopeful," "Alert," "Calm," and "Excited." Thus, the higher the score, the higher the Respondent rates in the positive affect dimension of emotional well-being based on the sub-components asked as part of the Leave-Behind Survey. If more than six items are missing the scale is also set to missing.

RwLBNEGAFFECT averages the inversion of questions "Afraid," "Upset," "Guilty," "Scared," "Frustrated," "Bored," "Hostile," "Jittery," "Ashamed," "Nervous," "Sad," and "Distressed." Thus, the higher the score, the higher the Respondent rates in the negative affect dimension of emotional well-being based on the sub-components asked as part of the Leave-Behind Survey. If more than six items are missing the scale is also set to missing.

S8LBPOSAFFECT6, S8LBNEGAFFECT6, SwLBPOSAFFECT, and SwLBNEGAFFECT are analogous spouse variables.

### Cross Wave Differences in Original HRS Data

Scales measuring different dimensions of emotional well-being are provided starting in Wave 8 (2006). While some emotional well-being components were asked in Wave 7 (2004), the pilot administration of the survey, responses differ significantly during this wave, so we do not produce measures for Wave 7.

In Wave 9 (2008), the HRS significantly revised the components used to assess the dimensions of emotional well-being choosing 25 components selected from the Positive and Negative Affect Schedule – Expanded Form (PANAS-X; Watson & Clark, 1994). Thus, beginning in Wave 9, RwLBPOSAFFECT and RwLBNEGAFFECT are produced. The 6-item scale is only produced for Wave 8 (2006) as R8LBPOSAFFECT6 and R8LBNEGAFFECT6 since the components used in these scales were also revised.

Beginning in Wave 9 (2008), the response scale for input questions also changes as part of the adoption of new input PANAS-X questions. Response options continue to be graded on a five-point scale, but they no longer range from "1=All of the time" to "5=None of the time" and instead range from "1=Very much" to "5=Not at all."

By design the Leave-Behind Survey is administered to select Respondents once every four years or every other wave. As a result, Respondents are only eligible to complete the survey in alternating waves. Respondents who did not respond because they are ineligible to participate in a wave are marked ".A" to indicate they are assigned to the alternative cohort.

### HRS Variables Used

HRS 2006–2012:

xLB027A	Q27A. FEEL CHEERFUL
xLB027B	Q27B. IN GOOD SPIRITS
xLB027C	Q27C. EXTREMELY HAPPY
xLB027D	Q27D. CALM AND PEACEFUL
xLB027E	Q27E. SATISFIED
xLB027F	Q27F. FULL OF LIFE
xLB027I	Q27I. DEPRESSED NOTHING CHEERING
xLB027J	Q27J. HOPELESS
xLB027K	Q27K. RESTLESS OR FIDGETY
xLB027L	Q27L. EVERYTHING WAS AN EFFORT
xLB027M	Q27M. WORTHLESS
xLB027N	Q27N. NERVOUS

HRS 2006–2020:

xLBCOMP	MODE COMPLETED LEAVE BEHIND QNAIRE

## General Comments

Construction of the scales based on information elicited in the Leave-Behind Survey following the instructions in the [HRS 2006-2022 HRS Psychosocial and Lifestyle Questionnaire User Guide](#) unless otherwise noted. Harmonization and processing occur for all Leave-Behind Measures. If more than half of HRS Leave-Behind components in a scale are missing, the scale is set to ".P" missing due to partial scale inputs. If a Respondent did not return the questionnaire, scales and measure are set to ".N" to indicate not returned. The range for the RwLBSATWLF scale changes beginning in Wave 9 (2008) from 1-6 to 1-7. It is recommended that users carefully consider making adjustments to Wave 8 (2006) or to their analytic methods to account for this change when using data from multiple waves.

## How Constructed

RwLBSATWLF is a scale indicator used to assess the Respondent's self-assessed quality of life. It is based on items drawn from Diener's measure of Satisfaction with Life. In Wave 8 (2006) responses indicate agreement with an item is using one of six categories, "1=Strongly Disagree," "2=Somewhat Disagree," "3=Slightly disagree," "4=Slightly agree," "5=Somewhat agree," or "6=Strongly agree." Items are scored 1-6 and then averaged to create the scale. Beginning in Wave 9 (2008) an additional category "4=Neither agree nor disagree" was added as a midpoint for the response scale and all items were scored 1-7 and then averaged.

RwLBSATHOME, RwLBSATCITY, RwLBSATLEISURE, RwLBSATFAM, RwLBSATFIN, RwLBSATINC, RwLBSATHLTH, and RwLBSATLIFE measure individual's subjective evaluations of well-being in important domains of life. Responses indicate domain specific satisfaction using one of five categories, "1=Completely satisfied," "2=Very satisfied," "3=Some what satisfied," "4=Not very satisfied," or "5=Not at all satisfied." Responses are reverse coded 1-5 so that higher scores correspond to greater satisfaction. R8LBSATFIN is an exception and has reversed response items from "1=Not at all satisfied" to "5=Completely satisfied" only in Wave 8 (2006) is therefore not inverted to be harmonized consistently.

RwLBSATWLF averages the following items: "In most ways my life is close to ideal," "The conditions of my life are excellent," "I

am satisfied with my life," "So far, I have gotten the important things I want in life," and "If I could live my life again, I would change almost nothing," Thus, the higher the score, the higher the Respondent's self-assessed quality of life based on the components asked as part of the Leave-Behind Survey. If more than two items are missing the scale is also set to missing.

RwLBSATHOME, RwLBSATCITY, RwLBSATLEISURE, RwLBSATFAM, RwLBSATFIN, RwLBSATINC, RwLBSATHLTH, and RwLBSATLIFE measure how satisfied the Respondent is with certain domains of life. RwLBSATHOME inverts satisfaction with "The condition of the place where you live (house or apartment)," RwLBSATCITY inverts satisfaction with "The city or town you live in," RwLBSATLEISURE inverts satisfaction with "Your daily life and leisure activities," RwLBSATFAM inverts satisfaction with "Your family life," RwLBSATINC inverts satisfaction with "The total income of your household," RwLBSATHLTH inverts satisfaction with "Your health," and RwLBSATLIFE inverts satisfaction with "Your life as a whole these days." RwLBSATFIN inverts satisfaction with "Your present financial situation" except in Wave 8 (2006) where the response scale already corresponds to higher levels of satisfaction. Thus, the higher the score, the higher the Respondent's satisfaction in a given life domain based on the questions included in the Leave-Behind Survey.

SwLBSATWLF, SwLBSATHOME, SwLBSATCITY, SwLBSATLEISURE, SwLBSATFAM, SwLBSATFIN, SwLBSATINC, SwLBSATHLTH, and SwLBSATLIFE provide analogous spouse variables.

### Cross Wave Differences in Original HRS Data

Life satisfaction, a component of subjective well-being, is provided starting in Wave 8 (2006). While some subjective well-being measures were asked in Wave 7 (2004), the pilot administration of the survey, responses differ significantly during this wave, so we do not produce measures for Wave 7.

RwLBSATFIN is also provided beginning in Wave 8 (2006). While it shares the same response scale as later waves, the LB survey presents the response options in the opposite order of other waves. The harmonized variable adjusts for this difference so that greater satisfaction is always scored higher.

Beginning in Wave 9 (2008), the HRS changed the response scale for input variables of RwLBSATWLF from a six-point to a seven-point scale. This change is important to note when comparing Wave 8 (2006) to subsequent waves. Researchers may consider rescaling R8LBSATWLF for better comparisons or adapting their analytic approach in other ways to adjust for this difference.

Beginning in Wave 10 (2010), HRS added a life domain question about satisfaction with income which is provided as RwLBSATINC.

In Wave 12 (2014), HRS stopped asking Respondents to rate their life as a whole as part of the Leave-Behind Survey and included this question in the core survey where it is asked of all Respondents. See xB000 in the HRS core survey.

By design the Leave-Behind Survey is administered to select Respondents once every four years or every other wave. As a result, Respondents are only eligible to complete the survey in alternating waves. Respondents who did not respond because they are ineligible to participate in a wave are marked ".A" to indicate they are assigned to the alternative cohort.

### HRS Variables Used

#### HRS 2020:

## **Appendix A**

## Section A: Demographics

### ID Adjustments

In 2020, one Respondent married another HRS Respondent. HHIDPN=541986010, who entered the survey in 2016, married HHIDPN=541110010. We changed HHIDPN=541986010 to be HHIDPN=541110020 and set RAOHRSID=541986010, RAOVRLAP=3 and RAOVRAYR=2016. We set the sub-household ID for HHIDPN=541110020 to 1 until they marry in 2020, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2020. For example, for HHIDPN=541110020, H13HHID=5411101, H14HHID=5411101, and H15HHID= 5411100.

In 2018, two Respondents married another HRS Respondent. HHIDPN=906126010, who entered the survey in 2010, married HHIDPN=906543010. We changed HHIDPN=906126010 to be HHIDPN=906543020 and set RAOHRSID=906126010, RAOVRLAP=3 and RAOVRAYR=2010. HHIDPN=544849010, who entered the survey in 2016, married HHIDPN=540162010. We changed HHIDPN= 544849010 to be HHIDPN=540162020 and set RAOHRSID=544849010, RAOVRLAP=3 and RAOVRAYR=2016. For both cases we set the sub-household ID to 1 until they marry in 2018, at which point we set it to 0, to match their spouse. This ensures they are recorded as a separate household until they marry in 2018. For example, for HHIDPN=540162020, H13HHID=5401621 and H14HHID= 5401620.

In 2012, based on information from HRS, HHID=202173 in all household level modules should be HHID=202073 and NPN\_FIN=010. HHIDPN=202147020 was dropped and the following ID changes were made:  
HHIDPN=59855021 changed to 59855010  
HHIDPN=95650041 changed to 95650010  
HHIDPN=502432021 changed to 502432010  
HHIDPN=520845011 changed to 520845020

In 2010, based on information from HRS, HHIDPN= 526934010 changed to 525520020 and HHIDPN= 529766010 changed to 520845020. The following cases were dropped: HHIDPN=920337010, 920337020, 902054010 and 532056010.

One case is married to an HRS-AHEAD overlap case in Wave 1 but not identified as an overlap on the Tracker file. We flag them as an HRS-AHEAD overlap case (RAOVRLAP = 1) with RAOHRSID = 20582020 and HHIDPN = 204940020. The only wave to which this case responds is Wave 1. Otherwise, all HRS-AHEAD overlap cases are identified by their AHEAD HHIDPNs on the RAND HRS Longitudinal File.

The AHEAD-AHEAD overlap cases are 205906010 who becomes 205864011 in 1998, and 205399010 who becomes 208545010 in 2000. On the RAND HRS Longitudinal File these cases are identified as 205864011 and 208545010, with RAOVRAYR set to 1995 and 1998, respectively. RAOAHDID holds their original 1993 HHIDPNs.

In 2004, two households were identified and selected to be in the HRS survey. Both these households were 2-person households containing a married couple. However, there is a lag between when a household is identified and when they actually start to answer survey questions. So, it was 2010 before they actually responded to any HRS survey questions. By 2010, these households had split and so, in the 2010 Core data we had the following IDs HHIDPN=526934010 split from HHIDPN=525520010 and HHIDPN=529766010 split from HHIDPN=520845010.

By 2012, these couples had reunited and so in the 2012 Tracker file, their IDs change from  
HHIDPN=526934010 to HHIDPN=525520020  
HHIDPN=529766010 to HHIDPN=520845020

In the RAND HRS data products, these cases are referenced by their 2012 IDs. The IDs they had in the 2010 Core data can be found in RAOHRSID.

Based on data alerts from HRS, we have made several changes to cases in 2000 and 2002. In 2002, HHIDPNs 22965040 and

22965041 are deleted. This was the only wave where 22965041 responded so this case has been deleted from the RAND HRS Longitudinal File. In the other case, 22965040 responds to other waves so is still included in the RAND HRS Longitudinal File but has INW6=0. In 2000, HHIDPN 211430021 is deleted and 211430020 is set to not partnered. Also in 2000, HHIDPN 75573041 is changed to 75573010 as is S5HHIDPN for 75573040, and HHIDPN 56354031 has been dropped because it was found to be a duplicate of 56354020.

In Wave 3H, there are a few households that appear to be reunited based on answers to questions in the CoverSheet section. They are reunited in Wave 4, but have different sub-household IDs in Wave 3. We reunite them in Wave 3. These households are: 17520 (PNs 010 and 040), 22999 (PNs 010 and 020), 40609 (PNs 010 and 020), 40441 (PNs 010 and 020), 50945 (PNs 010 and 040). These cases will have different sub-household IDs in H3HHID from the ESubHH found in the Tracker and core 1996 files. The spouse PNs will also differ.

In 1994, one household, 15730 is split in the core data, but together in Tracker file. In this household, 15730.020 was interviewed, then died before the widow (15730.030) was interviewed. We treat these two cases as being in separate households, as they are in the core data.

In some other households, the Tracker file shows a non-responding spouse, but the core data indicates that the couple being split. We treat these couples as split. In most households, this involves a change for the non-responding spouse so that the sub-household ID on this file differs from that on the Tracker file but still matches that on the core data. For two households, 10646 and 65564, FSUBHH in H4HHID also differs from that on the core 1998 data for the responding ex-spouse. For these two households, and for 23476 and 84287, the spouse PN also differs from that in the Tracker, but the FPN\_SP for these cases is blank in the 1998 core data.

In some cases the Tracker file assigns a spouse PN for a deceased spouse. In other cases the spouse PN is missing on the Tracker file but available in the core data. We set spouse PN to missing if it refers to a deceased spouse, and we fill missing spouse PNs from core data if they are missing on the Tracker file.

<b>Section B: Employment History</b>
--------------------------------------

Some adjustments are made to specific cases that seemed to have unreasonable wage data. They are listed below.

*/\* One case in Wave 1 apparently reports an annual income as a biweekly rate \*/*

```
if hhidpn=72106010 then V2736=6 ;
```

*/\* One case in W2H reports making 9994 hourly in w2 this looks like a missing value, doesn't fit with income, other waves, Make it missing \*/*

```
if HHIDPN=64609040 and W3637=9994 then W3637=99994 ;
```

*/\* One case in Wave 2H apparently reports their annual income as an hourly rate \*/*

```
if hhidpn=76493010 then do ;
  w3631=1 ;          /* make howpd salaried */
  w3632=w3637 ;     /* set to hourly rate reported */
  w3633=6 ;         /* set period to yearly */
end ;
```

*/\* Two cases in Wave 2H apparently reports their annual income as an hourly rate \*/*

```
if hhidpn=13631020 and W3633=2 then W3633=6;
if hhidpn=49393010 and W3633=2 then W3633=6;
```

*/\* Two case in Wave 3H apparently reported their annual income in the hourly variable. \*/*

```
if hhidpn=61179011 then e3140=6 ;
if hhidpn=65169010 then do ;
  e2772=1 ;          /* make howpd salaried */
  e2774=e2781 ;     /* set to hourly rate reported */
  e2775=6 ;         /* set period to yearly */
end ;
```

*/\* One case in Wave 3H reports monthly rate that, when compared to amount earned LCY, seems to be 100x the actual \*/*

```
if hhidpn=18048010 then E2774=E2774/100 ;
```

*/\* One case in Wave 3A has an unusual and high hourly rate. No earnings information is available; We set wages to missing \*/*

```
if HHIDPN=203514010 then D2870=. ;
```

*/\* One case in Wave 7 apparently reports their annual income as monthly \*/*

```
if hhidpn=200661020 and KJ192=4 then KJ192=6;
```

*/\* Two case in Wave 7 has a typo in their hourly rate. Forgot the decimal place for dollars and cents \*/*

```
if hhidpn=51554030 and KJ216=1300 then KJ216=13;
if hhidpn=502205010 and KJ206=539292 then KJ206=53929.2;
```

*/\* Two cases in Wave 7 apparently reported their annual income in the hourly variable. \*/*

```
if hhidpn in (123505010 124383010) then JJ216 = JJ216/JJ172/JJ179 ;
```

*/\* Four cases in Wave 7 reported seemingly annual income in JJ206 \*/*

```
if hhidpn in (45438010 137183010 179842020 501770020) then JJ210=6 ;
```

*/\* One case in Wave 7 reports receiving \$100,000 a week from SE \*/*

```
if hhidpn=501311020 then do;
  jj188=.m ;
  jj192=.m ;
end;
```

*/\* One case in Wave 7 reports receiving 36 million in overtime per month \*/*

```
if hhidpn = 501770020 then do ;  
jj225 = .m ;  
jj226 = .m ;  
end;
```

*/\* One case in Wave 8 apparently reports their annual income as bi-monthly \*/*

```
if hhidpn=12967010 and KJ210=5 then KJ210=6;
```

*/\* One case in Wave 9 apparently reports their annual income as monthly \*/*

```
if hhidpn=501707020 and LJ210=4 then LJ210=6;
```

*/\* One case in Wave 10 apparently reports their annual income as hourly \*/*

```
if hhidpn=903516010 and MJ216=55000 then MJ216=26.45;
```

**Section C: Medicare Part B and Part D Premiums**

To determine both whether, and for how many months, Part B and/or Part D premiums were deducted from Social Security income in the last calendar year (LCY), we developed several rules that incorporate information from the RAND HRS Fat Files, the RAND HRS Detailed Imputations File, and the RAND HRS Longitudinal File. Central to these rules is when people become eligible for Medicare, which is generally 65 years of age. However, people can become eligible sooner, as is the case for those who have been receiving SSDI for more than 24 months. To address this requirement, we assume that anyone who received SSDI for all 12 months in the last calendar year (and meets the other criteria described below) had Part B and/or Part D premiums deducted from their Social Security income. Otherwise, we assume these premiums were deducted only in those months when the individual was 65 years of age (or more) in the last calendar year. The rules are as follows:

1). First, flag Respondents who meet the minimum criteria for whether Part B and/or Part D premiums should be added back to reported Social Security income:

a). Part B:

- Covered by Medicare Part B ( $xN004^{48} = 1$  (Yes)), **and**
- No Medicaid coverage in the last two years/since previous interview ( $xN005^{49} = 5$  (No)), **and**
- Received Social Security Retirement income ( $[R/S]wIOSS = 1$  (Yes)) for at least one month in LCY ( $[R/S]wNSS^{50} > 0$ ), **or**
- Received Social Security Disability income ( $[R/S]wIOSDI = 1$  (Yes)) for at least one month in LCY ( $[R/S]wNSDI^{51} > 0$ ), **or** (in Waves 1 and 2A)
- Received Social Security "Joint" Check ( $HwIOSSJ = 1$  (Yes)) for at least one month in LCY ( $HwNSSJ^{52} > 0$ )

b). Part D:

- Medicare Part D premium deducted from Social Security check ( $xN423$  (Waves 9 and 10) = 1 (Yes)), **and**
- No Medicaid coverage in the last two years/since previous interview ( $xN005$  (Waves 9 and 10) = 5 (No)), **and**
- Received Social Security Retirement income ( $[R/S]wIOSS = 1$  (Yes)) for at least one month in LCY ( $[R/S]wNSS > 0$ ), **or**
- Received Social Security Disability income ( $[R/S]wIOSDI = 1$  (Yes)) for at least one month in LCY ( $[R/S]wNSDI > 0$ )

2). For Respondents who do not meet the above minimum criteria, do not add Part B and/or Part D premiums back to reported Social Security income.

3). For Respondents who do meet the above minimum criteria, perform some additional checks:

a). Part B and Part D (same criteria):

- IF received Social Security Retirement income LCY ( $[R/S]wIOSS = 1$  (Yes)):
  - ⇒ IF not 65 years of age in LCY, do not add premiums back to reported Social Security income
  - ⇒ ELSE IF 65 years of age (or more) in LCY, do add premiums back to reported Social Security income
- ELSE IF (in Waves 1 and 2A) received Social Security "Joint" Check LCY ( $HwIOSSJ = 1$  (Yes)):
  - ⇒ IF not 65 years of age in LCY, do not add premiums back to reported Social Security income

<sup>48</sup>In Waves 1 and 2H, there is one lead in question (V6602 / W6700) that asks whether the Respondent is currently covered by any federal insurance programs. If they are, they check all programs that apply. In Wave 1, V6603 is for Medicare (1 = Yes), and in Wave 2H, answers are recorded in W6701, W6702, W6703, and W6704, so one must look across all items to see if this option was chosen (1 = Medicare). In neither wave, however, is the type of Medicare specified. For simplicity, we assume that Respondents who report having Medicare are enrolled in Medicare Part B.

<sup>49</sup>In Waves 1 and 2H, the sequence of questions summarized in the previous footnote also allows Respondents to indicate whether they are currently covered by Medicaid. In Wave 1, V6604 is for Medicaid (1 = Yes), and in Wave 2H, one must look across all the aforementioned items to see if this option was chosen (2 = Medicaid). In Wave 2A, B1838 also asks whether the Respondent is currently covered by Medicaid. For simplicity, we assume that Respondents who are currently not covered by Medicaid were also not covered by Medicaid at any time since the previous interview / in the last two years.

<sup>50</sup> $[R/S]wNSS$  are currently not available For Waves 1, 2, and 3A in the RAND HRS Detailed Imputations File. We will provide them in a future release.

<sup>51</sup> $[R/S]wNSDI$  are currently not available For Waves 1, 2, and 3A in the RAND HRS Detailed Imputations File. We will provide them in a future release.

<sup>52</sup> $HwNSSJ$  is currently not available for Waves 1 and 2A in the RAND HRS Detailed Imputations File. We will provide them in a future release.

⇒ ELSE IF 65 years of age (or more) in LCY, do add premiums back to reported Social Security income

- ELSE IF received Social Security Disability income LCY ([R/S]wIOSDI = 1 (Yes)):

⇒ IF # of months received Social Security Disability income LCY = 12 ([R/S]wNSDI = 12), do add premiums back to reported Social Security income

⇒ ELSE IF # of months received Social Security Disability income LCY < 12 ([R/S]wNSDI < 12):

▷ IF not 65 years of age in LCY, do not add premiums back to reported Social Security income

▷ ELSE IF 65 years of age (or more) in LCY, do add premiums back to reported Social Security income

4). Finally, for Respondents where Part B and/or Part D premiums will be added back to reported Social Security income, determine the # of months deductions were made:

a). Part B and Part D (same criteria):

- IF received Social Security Retirement income LCY ([R/S]wIOSS = 1 (Yes)):

⇒ # of months deductions were made = minimum of the # of months received Social Security Retirement income LCY ([R/S]wNSS) and the # of months the Respondent was 65 years of age (or more) in LCY

(i.e., premiums can only have been deducted from Social Security Retirement income in those months the Respondent was receiving this income and was 65 years of age or more)

- ELSE IF (in Wave 1 and 2A) received Social Security "Joint" Check LCY (HwIOSSJ = 1 (Yes)):

⇒ # of months deductions were made = minimum of the # of months received Social Security "Joint" Check LCY (HwNSSJ) and the # of months the Respondent was 65 years of age (or more) in LCY

(i.e., premiums can only have been deducted from Social Security Retirement income in those months the Respondent was receiving this income and was 65 years of age or more)

- ELSE IF received Social Security Disability income LCY ([R/S]wIOSDI = 1 (Yes)):

⇒ IF # of months received Social Security Disability income LCY = 12 ([R/S]wNSDI = 12):

▷ # of months deductions were made = 12

⇒ ELSE IF # of months received Social Security Disability income LCY < 12 ([R/S]wNSDI < 12):

▷ # of months deductions were made = minimum of the # of months received Social Security Disability income LCY ([R/S]wNSDI) and the # of months the Respondent was 65 years of age (or more) in LCY

(i.e., premiums can only have been deducted from Social Security Disability income in those months the Respondent was receiving this income and was 65 years of age or more)

## Section D: OPN Adjustments

This section contains SAS code that adjusts OPN (Other Person Number) values in order to maintain consistency across waves and survey sections. It also notes the OPN-level HRS Data Alert code that has been incorporated into the RAND HRS Longitudinal File.

### 1992 OPN Adjustments

In order to match 1992 overlap cases with later waves, we need to recode the HHID and OPN. The matching process is based on 1992 name file and birth year then comparing with name files and birth year in later wave. These 1992 overlap cases link with the correct HH/OPN in later waves.

Here is the code for matching the overlap cases of OPNs in 1992:

```
if hhid = "010417" then do;
  hhid = "200119";
  if opn="201" then opn="112";
  if opn="202" then opn="041";
  if opn="203" then opn="042";

    else if opn="102" then opn="101";
end;

```

\* There are 5 cases in adjusted HHID households above for which the names could not be found in later waves so the original OPN was kept.

### 1993 OPN Adjustments

In order to match 1993 OPNs with later waves, we need to recode several OPN values on the bop21 file per the HRS Data Alert: <https://hrsdata.isr.umich.edu/data-products/data-alerts/39267>. We implemented the steps as described.

Additionally, we changed the OPN for one AHEAD-AHEAD overlap case to match 1998 IDs:

```

if hhid="205864" then do;
    if opn="112" then opn="115" ;
    if opn="113" then opn="116" ;
    if opn="114" then opn="117" ;
    if opn="115" then opn="118" ;
    if opn="116" then opn="119" ;
end;

```

### 1995 OPN Adjustments

In 1995, we identified several OPNs on the Helper List that did not appear on the 1995 A95E\_R dataset. We examined likely matches between the files based on relationship code and have made the following adjustments to the A95E\_R dataset to make the matches:

```

* First ADL OPN=041 and lost Helper list opn is kid;
_D1961=D1961;
if D1961="041" then do;
    if hhidpn=202664010 then do; _fixid=1; D1961="113"; end;
    if hhidpn=207085010 then do; _fixid=1; D1961="115"; end;
    if hhidpn=207377020 then do; _fixid=1; D1961="117"; end;
end;

end;

```

### 1996 OPN Adjustments

Similar to 1995, in 1996 we identified several OPNs on the Helper List that did not appear on the 1996 H96E\_R dataset. We examined likely matches between the files based on relationship code and have made the following adjustments to the H96E\_R dataset to make the matches:

```

_E1976=E1976;
  if E1976="997" then do;
if hhidpn=10147010 then do; _fixid=1; E1976="021"; end;
  if hhidpn=13426010 then do; _fixid=1; E1976="021"; end;
  if hhidpn=16603010 then do; _fixid=1; E1976="021"; end;
  if hhidpn=41855020 then do; _fixid=1; E1976="021"; end;
  if hhidpn=60370010 then do; _fixid=1; E1976="021"; end;
end;

* Second ADL OPN;
_E1990=E1990;
if E1990="997" then do;
  if hhidpn=22035040 then do; _fixid=1; E1990="022"; end;
  if hhidpn=22229020 then do; _fixid=1; E1990="022"; end;
  if hhidpn=51863020 then do; _fixid=1; E1990="022"; end;
  if hhidpn=59795020 then do; _fixid=1; E1990="022"; end;
  if hhidpn=60370010 then do; _fixid=1; E1990="022"; end;
  if hhidpn=85432020 then do; _fixid=1; E1990="022"; end;
end;

* Third ADL OPN;
_E1999=E1999;
if E1999="997" then do;

```

```

    if hhidpn=80335020 then do; _fixid=1; E1999="023"; end;
end;
* First IADL OPN;
_E2056=E2056;
if E2056="997" then do;

end;

* Second Money OPN;
_E2109=E2109;
if E2109="997" then do;
    if hhidpn=12987010 then do; _fixid=1; E2109="035"; end;
end;

```

### **2004 OPN Adjustments**

There are N=36 cases in E\_MC but not in PR\_MC. The OPN has been corrected in E\_MC based on the "Child Index Number" from both files: JX054\_MC and JEX054. Apply the following code to raw HRS E\_MC data.

```

if hhidc="023919" and opn="207" then opn="208" ;
if hhidc="046119" and opn="154" then opn="401" ;
if hhidc="052103" and opn="101" then opn="401" ;
if hhidc="054247" and opn="308" then opn="317" ;
if hhidc="058589" and jsubhh="2" and opn="103" then opn="401" ;
if hhidc="060807" and opn="155" then opn="401" ;
if hhidc="061015" and opn="106" then opn="401" ;
if hhidc="062092" and opn="206" then opn="401" ;
if hhidc="072467" and opn="210" then opn="211" ;
if hhidc="078481" and opn="101" then opn="401" ;
if hhidc="079180" and opn="158" then opn="401" ;
if hhidc="081662" and opn="162" then opn="401" ;
if hhidc="082643" and opn="201" then opn="412" ;
if hhidc="083559" and opn="154" then opn="401" ;
if hhidc="086263" and opn="101" then opn="401" ;

```

```

if hhidc="138373" and opn="112" then opn="401" ;
if hhidc="183748" and opn="112" then opn="401" ;
if hhidc="185419" and jsubhh="1" and opn="117" then opn="401" ;
if hhidc="200647" and opn="118" then opn="401" ;
if hhidc="201106" and opn="041" then opn="401" ;
if hhidc="201284" and opn="114" then opn="401" ;
if hhidc="202598" and opn="114" then opn="401" ;
if hhidc="203404" and opn="041" then opn="401" ;
if hhidc="204143" and opn="114" then opn="401" ;
if hhidc="204482" and opn="112" then opn="401" ;
if hhidc="204685" and opn="114" then opn="401" ;
if hhidc="205097" and opn="112" then opn="401" ;
if hhidc="205512" and opn="042" then opn="401" ;
if hhidc="206262" and opn="112" then opn="401" ;
if hhidc="206343" and opn="041" then opn="401" ;
if hhidc="206802" and opn="112" then opn="401" ;
if hhidc="208003" and opn="114" then opn="401" ;
if hhidc="208394" and opn="112" then opn="401" ;
if hhidc="210476" and opn="112" then opn="401" ;
if hhidc="213002" and opn="116" then opn="401" ;
if hhidc="213089" and opn="114" then opn="401" ;

```

### 2006 OPN Adjustments

One OPN in the PR\_MC data needs correction :

```
if hhidc="078302" and opn ="656" then opn="208" ;
```

There are N=5 cases in E\_MC but not in PR\_MC. The OPN has been corrected in E\_MC based on Family member index KEX054. Apply the following code to raw HRS E\_MC data:

```

if hhidc="011678" and ksubhh="2" and opn=106 then opn=104;
if hhidc="140397" and ksubhh="0" and opn=656 then opn=655;
if hhidc="182176" and ksubhh="0" and opn=655 then opn=654;
if hhidc="500937" and ksubhh="0" and opn=110 then opn=109;
if hhidc="501680" and ksubhh="0" and opn=107 then opn=105;

```

### 2008 OPN Adjustments

There are N=30 cases OPN in E\_MC but not in PR\_MC. Apply the following code to raw HRS E\_MC data:

```
if OPN in ("993" "997") then delete;
```

### 2010 OPN Adjustments

Similar to 1995, in 2010 we identified several OPNs on the Helper List that did not appear on the 2010 H10E\_R dataset. We examined likely matches between the files based on relationship code and have made the following adjustments to the H10E\_R dataset to make the matches:

```

* First ADL OPN;
  _MG032_1=MG032_1;
  if MG032_1 in ("997","998","999") then do;
if hhidpn= 35362010 then do; _fixid=1; MG032_1="101"; end;
if hhidpn= 36151010 then do; _fixid=1; MG032_1="201"; end;
if hhidpn= 37053020 then do; _fixid=1; MG032_1="101"; end;

```

```
if hhidpn= 38308041 then do; _fixid=1; MG032_1="101"; end;
if hhidpn= 40930010 then do; _fixid=1; MG032_1="201"; end;
if hhidpn= 85774030 then do; _fixid=1; MG032_1="201"; end;
if hhidpn=156625010 then do; _fixid=1; MG032_1="102"; end;
if hhidpn=200968010 then do; _fixid=1; MG032_1="112"; end;
if hhidpn=204379010 then do; _fixid=1; MG032_1="113"; end;
if hhidpn=207991010 then do; _fixid=1; MG032_1="112"; end;
if hhidpn=211714010 then do; _fixid=1; MG032_1="112"; end;
if hhidpn=213242010 then do; _fixid=1; MG032_1="112"; end;
if hhidpn=546592010 then do; _fixid=1; MG032_1="101"; end;
if hhidpn=904019020 then do; _fixid=1; MG032_1="101"; end;
if hhidpn=906177010 then do; _fixid=1; MG032_1="101"; end;
if hhidpn=907501010 then do; _fixid=1; MG032_1="101"; end;
if hhidpn=908387020 then do; _fixid=1; MG032_1="101"; end;
if hhidpn=918537010 then do; _fixid=1; MG032_1="101"; end;
end;
* Second ADL OPN;
  _MG032_2=MG032_2;
  if MG032_2 in ("997","998","999") then do;
    if hhidpn=523340010 then do; _fixid=1; MG032_2="101"; end;
  end;

* Fifth ADL OPN;
  _MG032_5=MG032_5;
  if MG032_5 in ("997","998","999") then do;
    if hhidpn=86314010 then do; _fixid=1; MG032_5="201"; end;
  end;
end;
```

### **2016 OPN Adjustments**

In 2016, we made the adjustments recommended in the HRS Data Alert: <https://hrsdata.isr.umich.edu/data-products/data-alerts/49696>.

### **2018 OPN Adjustments**

In 2018, we made the adjustments recommended in the HRS Data Alert: <https://hrsdata.isr.umich.edu/data-products/data-alerts/49697>.
